ABSTRACT

INSTAR is a storage and retrieval system for creating and maintaining large data banks consisting of data sets and copies of analyses performed on those data sets. INSTAR allows the retrieval of selected portions of a data set and the combination of several portions to form a new data set. File descriptions and data set abstracts are maintained with each data set in the bank.

The user's manual includes instructions for:

- i.* Reserving a data set,
- ii.* Describing a data set,
- iii.* Modifying a data set,
- iv.* Modifying a data set description,
- v.* Displaying a director of the data sets,
- vi.* Retrieving a data set description,
- vii.* Copying a data set,
- viii.* Selecting information from a data set, and
- ix.* Building a new data set from existing data.

Several examples are also listed and described.

INSTAR is written entirely in FORTRAN extended for use on the CDC 6400 computer system at Colorado State University.

INTRODUCTION

Program INSTAR has been designed as a data storage and retrieval system for the U.S. IBP Grassland Biome study. It is written in FORTRAN extended for use on the CDC 6400 computer system at Colorado State University. The purpose of INSTAR is to create and maintain large data banks consisting of data sets and copies of analyses performed on those data sets. It is also designed to facilitate the retrieval of information from the data bank.

Program INSTAR was developed as an alternative to using an existing program library system known as UPDATE, or purchasing the software for a more sophisticated information system. The UPDATE system was rejected for the following reasons:

- i.* The length of records was restricted to a maximum of 72 characters.
- ii.* Continuously incoming data could not easily be inserted at the end of a data set.
- iii.* The system offered no record-keeping capabilities for description of the data sets in the bank.
- iv.* Several users, attempting to change the data bank simultaneously, often destroyed each other's work.
- v.* Retrieval of information from the data bank was limited to copying entire data sets.

The purchase of a software system was rejected for two basic reasons: the price and the fact that the needs of the biome did not require the complexity offered by the systems. Consequently, program INSTAR was developed to do the same thing as the UPDATE system and yet bypass the major problems encountered. Since INSTAR lies within the median of storage and retrieval systems, its capabilities and limitations are listed. The capabilities of the program are:

- i.* It allows for the reservation of up to 500 data sets onto the data bank with no restrictions to the length of each data set.
- ii.* It allows for variable record length up to 133 characters.
- iii.* It allows easy insertion of incoming data onto the end of a data set.
- iv.* It permits easy modification of existing data.
- v.* It provides a data set description capability including a description of the format of the data set as well as an abstract description.
- vi.* It handles the rotation of master files automatically, preventing conflicts of users making simultaneous corrections.
- vii.* It allows the retrieval of entire data sets or any desired portion of a data set. Portions of different data sets may also be selected and combined.

The incapacibilities of program INSTAR are:

- i.* It cannot handle the selective retrieval of hierarchically ordered data sets. (The format of each record in the data set must be identical to permit selective retrieval.)
- ii.* The retrieval language is not based on Boolean operations and consequently is not as versatile as languages which are.
- iii.* The system will not sort the data retrieved or perform analyses such as sums, means, standard deviations, etc.

1. GENERAL DESCRIPTION

Program INSTAR allows for the reservation of data sets with a simple three- to five-word command stating the name of the data set and, if desired, the location of the data set in the bank. A data set may be original input data, or it may consist of computer output generated from the analyses of the data.

Since many people may be using the data bank, a set of records referenced by a single name may not be very meaningful for others. For this reason a file description capability is offered which allows the user to:

- i.* Include an abstract description explaining the purpose of the data set, the type of data collected, the method of collection, the units of measurement used, etc.
- ii.* Record the length of the records.
- iii.* Record the number of header and trailer records.
- iv.* Define the location and format of fields within the records.

The data set descriptions may then be used as a bookkeeping system for explaining what is on the bank. They may also be used for retrieval of selected portions of the data set from the bank. The data sets from the bank may be corrected and updated by inserting records into the data set, deleting existing records from a data set, or restoring previously deleted records. Since many data sets are being collected on a continuous basis, special provisions are made to allow easy appending of incoming data onto the end of an existing data set. Data sets may also be removed from the bank if desired. The structure and organization of the data bank may be retrieved with the word DISPLAY. This generates a list of all data set names reserved on the bank and the locations of each.

The description of a data set or of all data sets may be retrieved with the word DESCRIBE which will generate the following information for each data set desired:

- i.* The location of the data set in the bank.
- ii.* The number of records in the data set.
- iii.* The length of the records.
- iv.* The number of corrections made to the data set.

- v. The number of header and trailer records.
- vi. A list of the defined fields within each record, including the location and format of each field.
- vii. A copy of the abstract description.

An entire data set may be retrieved with the word COPY which will reproduce the data set exactly as it is reserved. A SELECT command allows for the retrieval of a portion of a data set rather than the entire file. This selection may be based on one of eight conditional relations between the given constant and one of the defined fields in the data set description. By using a series of the select command it is possible to create new data sets by combining information from several data sets.

Program INSTAR is oriented to the use of magnetic tapes and is consequently a sequential access system, i.e., the fifth record of a data set immediately follows the fourth record which immediately follows the third record. Since it is a sequential access system, each set of changes made to the bank involves recopying the entire bank to a new bank with the proper changes being made during the transfer. To allow this type of transfer, the system uses three master tape files on a rotational basis. One of the files contains the most current version of the bank. A second file contains the next most current version of the bank as a back-up, and the remaining file is used for the new version of the bank if any modifications are made. Program INSTAR handles all of the file rotational chores automatically.

2. DESCRIPTION OF DATA SETS FOR THE SAMPLE DATA BANK

The following pages contain a detailed users manual for program INSTAR. As each of the commands are explained, examples are also given. These examples are placed in boxes to separate them from the main text. They each refer back to the sample data bank described in this section, which consists of two data sets called WEATHER and PRECIP.

WEATHER is the standard weather observation data collected on the Pawnee Site beginning June 24, 1970 and continuing through August 8, 1970. Each record contains the date and time the observations were made, the minimum, maximum, and observed air temperatures, the minimum and maximum pan temperatures, the amount of evaporation from the pan, and a series of comments pertaining to the cloud cover, temperature, wind, and precipitation. This data set has 20 header records and 1 trailer record which supply additional information, but are not in the same format as the main data set.

PRECIP contains the precipitation data from the Central Plains Experimental Range at Nunn, Colorado. The precipitation is recorded daily in inches to the nearest .01 inch. The data exist for the entire year of 1970. It has no header or trailer records. The table below lists the record format for each file.

FORMAT FOR SAMPLE DATA SETS

DATA SET	FIELD NAME	LOCATION OF FIRST COLUMN	LOCATION OF LAST COLUMN	FORMAT
WEATHER	MONTH	1	2	(I2)
	DAY	3	4	(I2)
	YEAR	5	6	(I2)
	TIME	8	11	(I4)
	MAXAIRTEMP	13	15	(F3.0)
	MINAIRTEMP	16	18	(F3.0)
	OBSAIRTEMP	20	22	(F3.0)
	MAXPANTEMP	24	26	(F3.0)
	MINPANTEMP	27	29	(F3.0)
	EVAP	30	34	(F5.2)
	COMMENTS	35	80	(4A10,A6)
PRECIP	YEAR	1	2	(I2)
	MONTH	3	4	(I2)
	DAY	5	6	(I2)
	RAIN	11	15	(F5.2)

3. MASTER FILES, INPUT FILES, AND OUTPUT FILES

Master files. There are three master files which are used on a rotational basis to store the data bank. One of the files contains the most current version of the bank. A second file contains the next most current version as a back-up. The remaining file is to be used for the new version of the bank if any modifications are made. It is not important to the user which file is which because the system handles the rotation. It is only important that all three are available before executing the program bank. The default names of the master files are MF1, MF2, and MF3.

The master files are written by the I.O.C.S. system. The format for each logical record is:

Columns	Contents
1-133	Actual data
134-143	Data set or correction set identifier
144	Blank
145-149	Sequential record number
150	Status of the record

A directory file is also used in conjunction with the master files. It contains the number of the master file which is the most current version and the names and addresses of each data set in the bank. As with the master files, it is not important that the user knows what is on the directory file, but it must be retained and available before each execution. The default name of the file is DIR (see section 15).

Input files. The program assumes that all data will be input into the system through INPUT. However, if the record length is longer than 80

characters or if the data is already stored in the computer, it may be reserved by copying it to an alternate input file called COMMON before executing program INSTAR.

Output files. All data retrieved from the bank is stored into a disk file called DATA. This file is restricted to a maximum record length of 133 characters. It is rewound before execution of the program, but not after.

All data set descriptions and diagnostics are written onto OUTPUT.

Two SCRATCH files are used when the user is selecting portions of data sets and building his own data sets. The files are not available to the user. If he wants to use the data he has selected, he must copy it to the DATA file first (see section 11, Copying from SCRATCH). From the users viewpoint, these two files are considered as one file called SCRATCH. The record length is restricted to 133 characters.

4. DATA CARDS AND COMMAND CARDS

To distinguish command cards from data cards in the input deck, a restriction has been made that *all command cards will have an asterisk punched in column 1 and that no data cards will have an asterisk in column 1.*

Except for the asterisk in column 1, the format of the command card is fairly unrestricted. If a command is too long for one card, it may be continued to succeeding cards. (The asterisk is omitted on the continuation cards.) The program scans the word from left to right in search for one of five different possibilities: a *word*, an *integer number*, a *real number*, a *character string*, or a *format*. It prepares a list of these words, numbers, strings, and formats and then attempts to match this list to a predefined structure for each command.

Following is a brief description of each of the five command parts.

Words. A word is assumed if the first character encountered is a letter. The remaining characters may be either letters or numbers. The end of the word is assumed when a blank, comma, or period is encountered. The size of a word is restricted to a *maximum of 10 characters*.

Numbers. A number is assumed if the first character encountered is a number or a minus sign. The remaining characters must be either a number, a period, a blank, or a comma. The end of a number is assumed if a blank or comma is encountered. If there was no decimal point in the number it is assumed to be an integer number; otherwise it is assumed to be a real number. Integer numbers are limited to a maximum of 15 digits, and real numbers are limited to a maximum of 15 digits plus a maximum of 15 decimal digits.

Character strings. A character string is assumed if the first character encountered is a slash. The remaining characters are accepted as a part of a character string until another slash is encountered. A string cannot be continued from one card to the next. If there is not enough room on the remainder of the command card, it should begin on the next card (see section 12 for the use of a character string).

Formats. A format is assumed if the first character encountered is a left parenthesis. The remaining characters are accepted as part of the format until a right parenthesis is encountered. Any allowable FORTRAN format is acceptable, but the *length is restricted to 10 characters*. This is adequate for the purpose that they are used. As with strings, the format cannot be continued from one card to the next (see section 6 for the use of a format).

In the remaining sections, examples of the commands are given. In the examples *the capitalized words are necessary parts of the command*. The words

enclosed in quotation marks are defined by the user for each data set. Program INSTAR has a fairly restricted internal vocabulary. In order to improve that vocabulary for the user, a list of insignificant words are stored in memory. These words increase the readability of the commands, but must be ignored by the system. Consequently, the words written in lower case may be used for clarity or they may be left out without affecting the operation of the program INSTAR.

5. RESERVING A DATA SET

At the end of the bank. A file may be reserved at the end of the bank by giving it a name of up to 10 characters and using the command:

*RESERVE as "file name".

"File name" is the name of the data set.

<p>TO RESERVE THE SAMPLE DATA SET WEATHER, WE WOULD USE THE COMMAND: *RESERVE AS WEATHER. THE REDUCED FORM OF THE COMMAND WOULD BE: *RESERVE WEATHER.</p>

The data set to be reserved may immediately follow the command. If the data set is on the alternate input file, COMMON, the command,

*DATA is on COMMON

is needed. If a file description is to be included for the data set, it must be between the reserve command and the data or between the reserve

command and the *DATA is on COMMON command (see section 6 for the file description).

Specifying the location. If the location of the data set in the bank is important, the user may reserve the data set after any existing file on the data bank with the command:

*RESERVE as "file name" after "name of an existing file".

THE DATA SET PRECIP WOULD BE RESERVED AFTER THE
WEATHER DATA SET WITH THE COMMAND:

*RESERVE AS PRECIP AFTER WEATHER,

OR IN REDUCED FORM:

*RESERVE PRECIP WEATHER.

6. DESCRIBING A DATA SET

The user may prepare a file description for each reservation. If he chooses not to, a partial description is assumed that the length of each record is 80 characters, and that there are no header records, trailer records, or defined fields within a record. To change this assumed description, the following descriptor commands are needed:

Recording the length of records. The length of each record in the data set is defined with the command,

*LENGTH is "number" characters,

where "number" is the length and cannot exceed 133. If this command is omitted from the description, the length is assumed to be 80 characters.

THE COMMAND FOR THE WEATHER DATA SET IS:
*LENGTH IS 80 CHARACTERS,
OR IN REDUCED FORM:
*LENGTH 80

Recording the number of header records. Most data sets contain some initial information at the front which does not follow the same format as the data. These records may be set apart from the data with the command:

*FIRST "number" records are header records.

If the "number" is omitted, one record is assumed.

TO RECORD THE HEADER RECORDS FOR WEATHER WE WOULD
USE THE COMMAND:
*FIRST 20 RECORDS ARE HEADER RECORDS,
OR,
*FIRST 20

Recording the number of trailer records. Data sets are also often followed by extra informational records which do not have the same format as the data set. The records may be distinguished with the command:

*LAST "number" records are trailer records.

If the "number" is omitted, one record is assumed.

THE TRAILER RECORD FOR WEATHER COULD BE DEFINED
WITH THE COMMAND:
*LAST RECORD IS A TRAILER RECORD,
OR,
*LAST

Labelling fields within records. The structure of each record may be defined by using the label command, which specifies the name of the field, the first and last characters of the field, and the format of the field. The structure of the command is:

```
*LABEL columns 'number' to 'number' as 'field name'  
      type is 'format'
```

A "format" is the FORTRAN format for that field and is enclosed in parentheses. For example, an integer number in columns 6 to 10 would be (I5), a real number with two decimal places would be (F5.2) or an alphanumeric field would be (A5). The "format" for an alphanumeric field in columns 11 to 35 would be (2A10, A5). The "format" may be omitted from the command if desired. This will cause the program to assume that the field is alphanumeric. If the field is composed of only one column, the structure of the command will be:

```
*LABEL column 'number' as 'field name' type is 'format'.
```

Here the format must be (A1), (I1), (F1.0), or blank.

THE FOLLOWING COMMANDS WOULD RECORD THE FORMAT FOR
THE PRECIP FILE:

```
*LABEL COLUMNS 1 TO 2 AS YEAR TYPE IS (I2)  
*LABEL COLUMNS 3 TO 4 AS MONTH TYPE IS (I2)  
*LABEL COLUMNS 5 TO 6 AS DAY TYPE IS (I2)  
*LABEL COLUMNS 11 TO 15 AS RAIN TYPE IS (F5.2)
```

THE REDUCED FORM OF THE COMMANDS ARE:

*LABEL 1, 2 YEAR (I2)
*LABEL 3, 4 MONTH (I2)
*LABEL 5, 6 DAY (I2)
*LABEL 11, 15 RAIN (F5.2)

Overlapping of fields is permitted. For example, if for each record of a data set, columns 1 to 2 include the day, 4 to 5 include the month, and 7 to 8 include the year, the structure of the records may be defined as:

*LABEL 1 TO 2 AS DAY TYPE IS (I2)
*LABEL 4 TO 5 AS MONTH TYPE IS (I2)
*LABEL 7 TO 8 AS YEAR TYPE IS (I2)
*LABEL 1 TO 8 AS DATE TYPE IS (A8)

Overlapping of this type becomes very useful when using the select commands (see section 13).

Including an abstract. An abstract or a verbal description of the data set may be included with the file description by the use of the command.

*NOTE

All information which follows the word NOTE is accepted as a part of the abstract for the data set. The abstract continues until a card is encountered with an asterisk in column 1, signifying a new command. The abstract will normally include information pertaining to the source of the data, the method of collection of the data, the intended purpose of the data, the analyses performed on the data, and the location of a "hard" copy of the data.

If the *NOTE command is the last command in the description and the data set follows the description, an additional command is needed to differentiate between the end of the abstract and the beginning of the data set. Consequently the command

*DATA follows

must be inserted at that spot.

7. MODIFYING A DATA SET

Once a data set has been reserved in the bank, it may be modified or changed by inserting records into the data set, by deleting or deactivating the status of records in the data set, or by restoring or reactivating the status of records in the data set.

When a data set is reserved on the bank, the data set name is used as a data set identifier. Each record in the data set is also assigned a sequential record number. These two values are combined to form a unique record identification for each record in the set. The format of the record identification is the data set identifier, followed by a period, followed by the sequential record number. Examples are WEATHER.135 and PRECIP.14. If insertions are made into the data set, the records are given a correction set identifier in the place of the data set identifier. This identifier is COREC00001 for the first set of changes to the data set, COREC00002 for the second set of changes and so on. Examples are COREC00004.7 and COREC00037.1435.

When a record is stored into the bank, it is displayed on OUTPUT along with its record identification. Additional listings of the records and record identifications may be obtained by using the *COPY INCLUDING command (see section 11).

When making changes to the data bank, it is important for efficient running time to keep the order of the changes the same as the order that they will occur in the data bank. If changes are made to the third data set in the bank, the program will first transfer the first two data sets to the new file and then transfer the third set, making the necessary corrections. If the next command encountered calls for a change in one of the first two files, then the program must transfer the rest of the bank to the new master file, rotate the master files, and start all over. This necessitates copying the entire bank twice and results in a great loss of time.

Changes to records within a file must also be listed in the same order that the records occur on the file. Failure to do this will result in a fatal error, stating that the record identification cannot be located in the file.

Removing a data set from the bank. A data set may be removed from the bank with the command:

```
*DESTROY "file name"
```

This will remove the file name from the directory and will remove all records in that file from the bank.

THE PRECIP FILE WOULD BE REMOVED FROM THE BANK WITH
THE COMMAND,
*DESTROY PRECIP

Inserting records into a data set. New records may be inserted immediately after any record in the data by the command:

```
*INSERT in "file name" after "record id"
```

The program will then insert all records which follow until another command is encountered or until an end-of-file on INPUT is encountered.

TO INSERT A SET OF RECORDS INTO THE PRECIP DATA SET AFTER THE RECORD WITH A RECORD IDENTIFICATION OF PRECIP.14, WE WOULD USE THE COMMAND:

*INSERT IN PRECIP AFTER PRECIP.14

THE SHORTENED VERSION IS,

*INSERT PRECIP PRECIP.14

If the new records are to be inserted at the end of the data set, the "record id" may be omitted as below:

*INSERT in "file name".

INSERTING THE 1971 PRECIPITATION DATA INTO THE END OF PRECIP, WILL REQUIRE THE COMMAND,

*INSERT IN PRECIP,

OR,

*INSERT PRECIP.

The alternate input file may be used by following the insert command with the command:

*DATA is on COMMON

The program will then read and insert all records on the COMMON file until an end-of-file is encountered. The user does not need to respecify the length of records when making insertions. The length of the records which are inserted will be assumed to be the same as is declared on the file description.

IF THE SAME DATA ABOVE WERE ON TAPE RATHER THAN PUNCHED CARDS, THEY COULD BE INSERTED BY REFERENCING THE TAPE TO COMMON AND USING THE COMMANDS:

*INSERT IN PRECIP

*DATA IS ON COMMON,

OR THE REDUCED FORM,

*INSERT PRECIP

*DATA COMMON

Deleting records from a data set. A record may be deleted from the data set with the command:

*DELETE in "file name" "record id"

This command does not actually remove the record from the bank. It simply deactivates the status of the record so that it will be ignored by the copy and select commands. A series of records may be deactivated by the command:

*DELETE in "file name" from "record id" to "record id"

This will deactivate the two records specified plus all records which are between the two.

EXAMPLE COMMANDS WOULD BE:

*DELETE IN WEATHER WEATHER.15

*DELETE IN WEATHER FROM WEATHER.20 TO COREC00001.1

THE SHORTENED FORMS OF THESE COMMANDS ARE:

*DELETE WEATHER WEATHER.15

*DELETE WEATHER WEATHER.20, COREC00001.1

Restoring records. A previously deleted record may be reactivated by the command:

```
*RESTORE in "file name" "record id"
```

A series of records may be reactivated by the command:

```
*RESTORE in "file name" from "record id" to "record id"
```

This command is simply the reverse of the DELETE command.

THE RECORDS DELETED ABOVE COULD BE REACTIVATED WITH
THE COMMANDS:
*RESTORE IN WEATHER WEATHER.15
*RESTORE IN WEATHER FROM WEATHER.20 TO COREC00001.1
OR,
*RESTORE WEATHER WEATHER.15
*RESTORE WEATHER WEATHER.20, COREC00001.1

8. MODIFYING A FILE DESCRIPTION

Inserting descriptor commands. New descriptor commands may be inserted into a file description with the command:

```
*INSERT in "file name" as DESCRIPTOR records
```

The program will then accept all descriptor commands which follow and insert them at the front of the file description.

ASSUME THAT THE FOLLOWING COMMANDS WERE USED WHEN
THE PRECIP FILE WAS RESERVED:

*RESERVE AS PRECIP
*LABEL 1, 2 AS YEAR (I2)
*LABEL 3, 4 AS MONTH (I2)
*LABEL 5, 6 AS DAY (I2)
*LABEL 11, 16 AS RAIN (F5.2)

ASSUME ALSO THAT WE WANT TO RECORD COLUMNS 1 THRU 6 AS
DATE AND INCLUDE AN ABSTRACT DESCRIPTION. THE FOLLOWING
COMMANDS ARE REQUIRED:

*INSERT IN PRECIP AS DESCRIPTOR RECORDS
*LABEL 1, 6 AS DATE TYPE IS (I6)
*NOTE PRECIP CONTAINS THE PRECIPITATION
DATA FROM THE CENTRAL PLAINS EXPERIMENTAL
RANGE AT NUNN, COLORADO. THE DATA IS
RECORDED DAILY IN INCHES.

THE ABBREVIATED VERSION OF THE FIRST COMMAND WOULD BE:

*INSERT PRECIP DESCRIPTOR

Deleting descriptor commands. Descriptor records are assigned a
record identification in the same way that the data is assigned. Consequently
they may be deleted and restored in the same way with the commands:

*DELETE in "file name" "record id"
*DELETE in "file name" from "record id" to "record id"
*RESTORE in "file name" "record id"
*RESTORE in "file name" from "record id" to "record id"

Changing an abstract. Inserting records into an abstract depends on where they are inserted. If they are to be inserted in the middle or at the end of an abstract, the command is the same as for inserting data:

*INSERT in "file name" after "record id"

TO ADD TO THE DATA SET DESCRIPTION FOR PRECIP, THE FOLLOWING COMMANDS COULD BE USED. (THIS ASSUMES THAT THE LAST RECORD FOR THE CURRENT ABSTRACT HAS THE RECORD IDENTIFICATION OF COREC0001.4.)

*INSERT IN PRECIP AFTER COREC0001.4

THE DATA EXISTS FOR THE ENTIRE YEAR OF 1970

AND WAS RESERVED ON JANUARY 15, 1971.

If they are to be inserted at the front of the abstract, they must be inserted as a new NOTE command with the command:

*INSERT in "file name" as DESCRIPTOR records

Deleting records from the abstract is the same as deleting data with the regular DELETE commands.

The file description commands are stored in the bank in the same form as they are on the command cards. Consequently, care must be taken so that if a *NOTE command is inserted, the abstract is followed by another command before the data is encountered. This will occur only if there was no original file description and if the only descriptor inserted was an abstract. In this case the command *DATA FOLLOWS should be inserted after the abstract.

9. DISPLAYING A DIRECTORY OF THE DATA SETS

A list of all the files reserved on the bank and their corresponding addresses may be retrieved by the command:

*DISPLAY all files on the directory

The address shown will be the address of the last record in the data set.

10. RETRIEVING A DESCRIPTION OF A DATA SET

A brief description of the data set structure and a copy of the abstract may be retrieved by the command:

*DESCRIBE "file name"

The description will include:

- i.* The location of the file in the bank.
- ii.* The total number of records including descriptor commands and deactivated records.
- iii.* The length of each record.
- iv.* The number of corrections made to the data set.
- v.* The number of header records in the data set.
- vi.* The number of trailer records in the data set.
- vii.* A list of all the defined fields with their locations within the record and their formats.
- viii.* A copy of the abstract.

A file description for each of the data sets in the bank may be retrieved with the command:

*DESCRIBE ALL files

THE TWO DATA SETS IN THE EXAMPLE DATA BANK COULD
BE DESCRIBED WITH THE COMMANDS,

*DESCRIBE WEATHER

*DESCRIBE PRECIP,

OR WITH THE COMMAND

*DESCRIBE ALL

11. COPYING INFORMATION ONTO THE DATA FILE

A disk file called DATA is provided to contain all the data created by program BANK. This DATA file is created by copying from one of four different sources. The DATA file is rewound only at the beginning of the program. The data retrieved by a second copy command will follow the data from the first command.

Retrieving a data set from the bank. Entire data sets may be fetched and copied onto DATA with the command:

*COPY "file name"

This will generate a file including only the activated records of the data set. Record identifications will also be omitted.

THE SAMPLE DATA SET, WEATHER, COULD BE RETRIEVED
WITH THE COMMAND,

*COPY WEATHER

A listing of all deactivated and activated records including the file description records and record identifications may be obtained with the command:

*COPY "file name" INCLUDING everything

A LISTING OF THE ENTIRE CONTENTS OF THE PRECIP
FILE COULD BE OBTAINED WITH,
*COPY PRECIP INCLUDING

A specified sequence of records within a file may be copied to the DATA file with the use of the sequential record identifications. The form of the command is:

*COPY "file name" from "record id" to "record id"

All activated records between and including the two specified are copied to DATA along with the record identification for each. This command is somewhat restricted in that only a maximum of 115 characters per record will be printed out.

AN EXAMPLE OF THIS TYPE OF COMMAND WOULD BE,
*COPY WEATHER FROM WEATHER.50 TO WEATHER.81
OR,
*COPY WEATHER WEATHER.50, WEATHER.81

Copying from INPUT. Cards may be copied directly from the INPUT file to DATA with the command

*COPY INPUT

All records which follow the command will be copied from INPUT to the DATA file until a new command or an end-of-file is encountered.

Copying from COMMON. Records may be copied directly from the alternate input file, COMMON, to DATA with the command:

*COPY COMMON

All records on the disk file COMMON will be copied to DATA.

Copying from SCRATCH. Using the select commands only stores the data onto one of the SCRATCH files. The user cannot use the data he has created until it is copied to DATA with the command:

*COPY SCRATCH

This will copy all records from the last SCRATCH file created and will also erase or destroy all the information on the SCRATCH files.

12. SELECTING INFORMATION FROM A DATA SET

Information may be retrieved from any part or parts of a data set by the use of a select command. The user may select entire records from a file, defined fields within a record, or specified columns within a record. He may select the desired information on an unconditional basis or on a conditional basis. He may also combine selected information with other selected information to create his own data set.

Selecting information on a conditional basis depends on the value of a specified field within the record. The condition is specified as one of seven different relations between the field and a constant or constants. If the relation holds true for a record, the information will be selected. If the relation is false, the information will be ignored. The following list of relations may be used as the condition for the field:

- i.* EQUAL to "constant"
- ii.* NOT EQUAL to "constant"
- iii.* GREATER than "constant"
- iv.* LESS than "constant"
- v.* GREATER than or EQUAL to "constant"
- vi.* LESS than or EQUAL to "constant"
- vii.* BETWEEN "constant" and "constant"

A "constant" may be an integer number, a real number (decimal point included), or a string of characters (see section 4). If the constant is a character string, the comparisons will be on an alphabetic basis, i.e., the comparison for a field greater than a constant will hold true if the field alphabetically follows the constant.

Selecting records. Any number of records may be selected from a file with the command:

```
*SELECT from "file name" "number" RECORDS
```

The specified number of records, beginning immediately after the last header card, will be copied from the data set to the SCRATCH file.

THE FIRST 31 RECORDS FROM PRECIP COULD BE RETRIEVED
WITH,
*SELECT FROM PRECIP 31 RECORDS
OR,
*SELECT PRECIP 31 RECORDS

The entire data set may be copied to the SCRATCH file with the command:

```
*SELECT from "file name" ALL RECORDS
```

This will transfer only the actual data records; the header and trailer records will be omitted.

THE ACTUAL DATA FROM WEATHER CAN BE RETRIEVED WITH
THE COMMAND,
*SELECT FROM WEATHER ALL RECORDS
OR,
*SELECT WEATHER ALL RECORDS

The records may be selected on a conditional basis, depending on the value of a defined field within the record. The appropriate command is:

*SELECT from "file name" "number" RECORDS for which
values of "field name" are "relation"

The word ALL may be substituted for the "number" if desired. The SCRATCH file will then contain only the records for which the relation was true. The "field name" must be a defined field in the file description.

RETRIEVING THE PRECIP RECORDS FOR THE MONTH OF JULY
WOULD REQUIRE THE COMMAND,
*SELECT FROM PRECIP ALL RECORDS FOR
WHICH VALUES OF MONTH ARE EQUAL TO 7
THE ABBREVIATED VERSION OF THE SAME COMMAND IS:
*SELECT PRECIP ALL RECORDS MONTH EQUAL 7

Selecting fields. If a field is defined in the file description, its contents may be selected in three different ways: unconditionally, conditionally depending upon its own value, or conditionally depending on the value of another field.

For an unconditional selection, the form of the command is:

```
*SELECT from "file name" "number" values of "field name"  
for columns "number" to "number".
```

The specified number of values would be selected from the first of the data set and stored in the specified columns of the SCRATCH file. If the user desires all of the values in the file, the word ALL may be substituted for the first "number".

```
THE OBSERVED AIR-TEMPERATURE FROM THE WEATHER FILE  
MAY BE RETRIEVED WITH THE COMMAND,  
  
*SELECT FROM WEATHER ALL VALUES OF OBSAIRTEMP  
FOR COLUMNS 10 TO 20,  
  
OR,  
  
*SELECT WEATHER ALL OBSAIRTEMP 10, 20
```

For a conditional selection of a field depending on its own value, the command is:

```
*SELECT from "file name" "number" values of "field name"  
which are "relation" for columns "number" to "number".
```

The specified columns of the SCRATCH file will contain only the values of the field for which the relation holds true.

ALL MAXIMUM TEMPERATURES WHICH EXCEEDED 90° MAY BE
RETRIEVED FROM WEATHER WITH,

```
*SELECT FROM WEATHER ALL VALUES OF  
MAXAIRTEMP WHICH ARE GREATER THAN OR EQUAL  
TO 90.0 FOR COLUMNS 20 TO 30,
```

OR,

```
*SELECT WEATHER ALL MAXAIRTEMP GREATER EQUAL  
90.0 20, 30
```

For a conditional selection depending on the values of another field,
the command is:

```
*SELECT from "file name" "number" values of "field name"  
for which values of "field name" are "relation" for  
columns "number" to "number".
```

The contents of the second field will be fetched and compared for each
record. If the relation holds true, the contents of the first field will
be stored into the appropriate columns of the SCRATCH file. If all the
values are desired, the word ALL may be substituted for the first "number".

IF THE RESULTS FROM THE ABOVE EXAMPLE SEEM RATHER
MEANINGLESS, THE DATES FOR WHICH THE TEMPERATURE ROSE
TO 90 OR ABOVE MAY BE RETRIEVED WITH,

```
*SELECT FROM WEATHER ALL VALUES OF DATE FOR  
WHICH VALUES OF MAXAIRTEMP ARE GREATER THAN  
OR EQUAL TO 90.0 FOR COLUMNS 10 TO 20
```

OR,

```
*SELECT WEATHER ALL DATE MAXAIRTEMP GREATER  
EQUAL 90.0 10, 20
```

Selecting columns or portions of a record. If more than one field is to be selected, it will be easier to select certain columns of information. This may be done either unconditionally or conditionally, depending on the value of a defined field.

For an unconditional selection the command is:

```
*SELECT from "file name" "number" values of columns  
"number" to "number" for columns "number" to  
"number".
```

The appropriate columns will be fetched from the data set and stored in the specified columns of the SCRATCH file. ALL may be substituted for the first "number" if desired.

TO RETRIEVE THE DATES, TIMES, AND THE THREE AIR
TEMPERATURE READINGS FROM THE WEATHER FILE, WE COULD
USE

```
*SELECT FROM WEATHER ALL VALUES OF  
COLUMNS 1 TO 20 FOR COLUMNS 1 TO 20.
```

THE SHORTENED FORM IS,

```
*SELECT WEATHER ALL 1, 20, 1, 20.
```

For a conditional selection, the command is:

```
*SELECT from "file name" "number" values of columns  
"number" to "number" for which values of "field name"  
are "relation" for columns "number" to "number".
```

For each record the contents of the field will be fetched and compared. If the relation holds true, the information will be selected and stored

into the appropriate columns of the SCRATCH file. ALL may be used for the first number if desired.

THE SAME 20 COLUMNS OF INFORMATION COULD BE
RETRIEVED FOR THE MONTHS OF JUNE THROUGH AUGUST
WITH THE COMMAND,

```
*SELECT FROM WEATHER ALL VALUES OF COLUMNS  
1 TO 20 FOR WHICH MONTH IS BETWEEN 6 AND  
8 FOR COLUMNS 21 TO 40,
```

OR IN REDUCED FORM,

```
*SELECT WEATHER ALL 1, 20 MONTH BETWEEN  
6, 8, 21, 40.
```

13. BUILDING A DATA SET

Section 12 explained the procedures for selecting one type of information based on one condition. A series of select commands may be used to select information based on several conditions or to combine several types of information into one data set.

Selecting information based on several conditions. Information of this type is retrieved by selecting all records which agree with the first condition from the data set. Then all records which agree with the second condition may be selected from the SCRATCH file. The remaining conditions are selected from the SCRATCH file until all conditions are satisfied. Suppose, for example, that the sample data set, WEATHER, now contains daily temperature data from the years 1967 through 1971 (see section 2 for an example of the file description). It is desired that we know the days during April and May of 1970 for which the temperature was below the freezing point. There are consequently three conditions for the

selection: the year must be 1970, the month must be April or May, and the minimum air temperature must be below 32°F. The following commands would be used for this selection:

```
*SELECT FROM WEATHER ALL RECORDS FOR WHICH YEAR IS  
EQUAL TO 70
```

```
*SELECT FROM SCRATCH ALL RECORDS FOR WHICH MONTH IS  
BETWEEN 4 and 5
```

```
*SELECT FROM SCRATCH ALL VALUES OF COLUMNS 1 TO 12  
FOR WHICH MINAIRTEMP IS LESS THAN OR EQUAL TO 32  
FOR COLUMNS 2 TO 13
```

```
*COPY SCRATCH
```

Note that entire records are selected until the last condition is imposed. This is so that the records on the SCRATCH file will have the same format as the data set and the fields for the remaining conditions are where the file description says they are.

THE ABBREVIATED FORMS OF THE ABOVE COMMANDS WOULD
BE:

```
*SELECT WEATHER ALL RECORDS YEAR EQUAL 70  
*SELECT SCRATCH ALL RECORDS MONTH BETWEEN 4, 5  
*SELECT SCRATCH ALL 1, 12 MINAIRTEMP  
LESS EQUAL 32, 2, 13  
*COPY SCRATCH
```

Combining types of information. Information from one data set may be combined with information from another data set with the same method. Suppose, for example, that in addition to the WEATHER file the PRECIP file also is reserved for the same period, and we want to combine the two for 1970 (see section 2). The appropriate commands will be:

```
*SELECT FROM WEATHER ALL OF COLUMNS 1 TO 22 FOR WHICH YEAR IS  
EQUAL TO 70 FOR COLUMNS 1 TO 22
```

```
*SELECT FROM PRECIP ALL VALUES OF RAIN FOR WHICH VALUES  
OF YEAR ARE EQUAL TO 70 FOR COLUMNS 26 TO 30
```

```
*COPY SCRATCH
```

If the number of selections differ, the actual length of the SCRATCH file will be equal to the maximum number of selections made. For example, if 365 selections were made for the first command and only 360 selections were made for the second command, the length of the SCRATCH file would be 365 records and columns 26 to 30 would be blank for records 361 through 365.

THE ABBREVIATED FORMS FOR THE ABOVE COMMANDS ARE, *SELECT WEATHER ALL 1, 22 YEAR EQUAL 70, 1, 22 *SELECT PRECIP ALL RAIN YEAR EQUAL 70, 26, 30 *COPY SCRATCH

14. ERROR MESSAGES AND DIAGNOSTICS

Error messages are given in Fig. 1.

Diagnosics. The system prints two informative diagnostics which tell the user the location of the most current version of the bank. The first message comes at the start of the program to explain that "MF_ has been selected as the most current version of the bank." When all modifications have been made an additional message explains that "All previous changes have been made permanent. MF_ is now the most current version of the bank." This message also occurs when modifications to the files are not in the proper order, because the entire bank must be transferred and the files rotated.

Figure 1. List of Error Messages

Error Number	Message	Status
1	The contents of the directory file are meaningless. Recheck your control cards.	Fatal
2	The master file which has been declared as the most current version is empty. Recheck your control cards.	Fatal
3	The directory is empty implying the creation of a new bank. But the bank will not be created unless MF1, MF2, and MF3 are also empty. Recheck your control cards.	Fatal
4	A command was expected but not found. Error occurred at column _____.	Fatal
5	An illegal symbol has been encountered. Error occurred at column _____.	Fatal
6	A word or format has been encountered which is more than 10 characters.	Fatal
7	A string or format cannot be continued from one card to the next. Error occurred at column _____.	Fatal
8	The second significant word in a length command should be an integer number. Trouble encountered at the word _____.	Fatal
9	The length of records exceeds 133. Trouble encountered at the number _____.	Fatal
10	The second significant word of a label command should be the beginning column for that field. Trouble encountered at the word _____.	Fatal
11	The last column precedes the first column for the field being defined. Trouble encountered at the word _____.	Fatal
12	This command is not understood as a file descriptor. Trouble encountered at the word _____.	Fatal
13	An end of file on input has been encountered while reading in the file description. The location of the data has never been specified.	Fatal
14	The columns that the selected field is to be stored in are not correctly specified. Trouble encountered at the word _____.	Fatal
15	The file name cannot be located in the directory. Trouble encountered at the word _____.	Fatal
16	The field name cannot be located in the file description. Trouble encountered at the word _____.	Fatal
17	A relation identifier (EQUAL, NOT EQUAL, GREATER, LESS, or BETWEEN) was expected here. Trouble encountered at the word _____.	Fatal
18	Either a number or a string was expected here but not found. Trouble encountered at the word _____.	Fatal
20	This command is not understood. Trouble encountered at the word _____.	Fatal
21	The program is unable to determine whether records or fields are to be selected. Trouble encountered at the word _____.	Fatal
22	The program is either unable to locate the field specified or it is unable to determine the relation. Trouble encountered at the word _____.	Fatal
23	The user has requested that the SCRATCH file be duplicated.	Fatal
24	The record id _____ cannot be located in the file.	Fatal
25-30	A programming error has occurred in _____. Please take your output to Bob Robinson for correction.	Fatal
31	The record id _____ is improperly specified.	Fatal
32	This file name has already been reserved on the bank. Trouble encountered at the word _____.	Fatal
33	_____ records were encountered which did not agree with the format in the file description.	Non-fatal
34	The columns specified are less than the field size. The field is truncated.	Non-fatal

Another informative diagnostic is printed after each select command to show the number of selections that were made. If several select commands are used in a series, the length of the SCRATCH file will be equal to the maximum number of records that were selected.

Non-fatal error messages. The program also lists two non-fatal error messages when making selections. The first error message occurs if records were encountered for which a field doesn't fit the format that was defined for that field on the label command. This occurs only when the field is used as a basis for a conditional selection. If it does occur the record will not be selected.

An error occurs if a field is to be selected and not enough columns are allowed on the SCRATCH file for the field. For this case the rightmost columns of the field will be truncated and execution will continue.

Fatal error messages. Several user errors may occur which make it impossible or hazardous for the program to continue. For these a message is printed explaining the type of error made and the point in the command at which the error was encountered. The program will prevent the rotation of master files and execution will be halted by a call to the computer system to abort routine. The computer system dump can be suppressed with the command

*SUPPRESS ABORT.

Program errors. Since program INSTAR has been developed by mere human hands, there is a strong chance that the program is not logically perfect. Most of the logical errors will result in a conflict between the directory

and the master files. If this happens, a message will be printed out stating that: "A programming error has occurred in _____. Please take your output to Bob Robinson for correction."

Since the program should have complete control over aborting the job, all computer system dumps should be prevented also. If a user receives a computer system dump for anything other than an exceeded time limit or page limit, he should also take his output to Bob Robinson at GERL for correction of the program. A programming reference manual is also available for assistance in debugging logical errors in the system.

15. SETTING UP THE CONTROL CARDS

The execution card. The program is stored as a permanent binary file called BANK. The control card for executing the program is in the form:

$$\text{BANK}(p_1, p_2, p_3, p_4, p_5, p_6, p_7, p_8),$$

where:

p_1 is MF1 or the first master file,

p_2 is MF2 or the second master file,

p_3 is MF3 or the third master file,

p_4 is DIR or the directory file,

p_5 is DATA or the file generated by the COPY commands,

p_6 is COMMON or the alternate input file,

p_7 is INPUT or the source file containing the input commands, and

p_8 is OUTPUT or the listing file for all diagnostics and descriptions.

The names (e.g., MF1, DATA, etc.) given above are assumed names of the files.

However, any disk file name may be substituted in the control card. For

example, if I elect to use S1, S2, S3, and SD as my master files and directory and MYOWN as the alternate input file, the control cards are punched as follows:

```
JLIMITS.  
COMMON(S1)  
COMMON(S2)  
COMMON(S3)  
COMMON(SD)  
COMMON(MYOWN)  
ATTACH(BANK,BANK, ID=SWIFT, MR=1)  
REDUCE.  
BANK(S1,S2,S3,SD,,MYOWN)
```

Since a new name for the data file is not given, the name DATA will be assumed. INPUT and OUTPUT are also assumed for p₇ and p₈. To alleviate the conflict of users choosing the same names for common files, it is suggested that *no user declare the names MF1, MF2, MF3, DIR, DATA, or COMMON as common files.*

Time and page requirements. The time required by the program depends on the type of operations being performed as listed below.

- i.* Inserting or reserving records is accomplished at the rate of 125 records per second.
- ii.* Transferring records from master file to master file is accomplished at the rate of 875 records per second.
- iii.* Records are copied from a master file to the DATA file at the rate of 385 records per second.
- iv.* Skipping to a data set in the master file is 1200 records per second.
- v.* Selecting records unconditionally is 385 records per second.
- vi.* Selecting records conditionally is 300 records per second.
- vii.* Selecting fields unconditionally is 325 records per second.
- viii.* Selecting fields conditionally is 275 records per second.

As an example, if 1000 records were to be inserted and 5000 records were already in the bank, the time required would be approximately $1000/125$ plus $5000/875$ or 14 seconds. Or if a conditional selection of fields were to be made and there were 500 records in the data set and 8000 records preceding the data set, the time required would be $8000/1200$ plus $500/275$ or 9 seconds.

The page requirements depend on the number of records to be inserted, reserved, or deleted and the number of file descriptions requested. If file descriptions are requested, they will be printed one per page. All records which are reserved, inserted, or deleted are also printed onto the OUTPUT file. If this is not desired, the command:

*SUPPRESS LISTING

may be used before the RESERVE or INSERT command. This will halt the printing of reserved or inserted records onto OUTPUT for the remainder of the program.

16. KEEPING THE BANK ON PERMANENT FILES

The recent conversion to the Scope 3.3 operating system at the CSU Computer Center has eliminated the use of common disk files. Permanent disk files are available, but for security reasons, it is impossible to change the contents of a permanent file once it is cataloged. To avoid these problems, two additional commands have been added to the system. The first is,

*CATALOG as 'permanent file name' for 'user's identification'.

This command is required only once when the bank is first created. It must be the first command in the input deck.

```
THE COMMAND:

      *CATALOG AS TESTBANK FOR ROBINSON

WILL ACCOMPLISH THE SAME AS THE FOLLOWING FOUR CONTROL
CARDS.

      CATALOG(MF1,TESTBANK,CY=1, ID=ROBINSON,RP=999)
      CATALOG(MF2,TESTBANK,CY=2, ID=ROBINSON,RP=999)
      CATALOG(MF3,TESTBANK,CY=3, ID=ROBINSON,RP=999)
      CATALOG(DIR,TESTBANK,CY=4, ID=ROBINSON,RP=999)

THE ABBREVIATED COMMAND IS

      *CATALOG TESTBANK ROBINSON
```

The "permanent file name" must be 1 to 10 characters and the "user's identification" must be 1 to 9 characters. There will be no passwords associated with the files, and the retention period will be infinite or 999. The files MF1, MF2, MF3, and DIR will be cataloged as cycles 1, 2, 3, 4.

Subsequent runs which require the bank after it has been cataloged must have *as the first command,*

*BANK is on "permanent file name" for "user's identification".

Program INSTAR will then attach, purge, and recatalog the master files as it needs them.

THE COMMAND,
*BANK IS ON TESTBANK FOR ROBINSON
WILL ATTACH ALL 4 CYCLES FOR TESTBANK AS MF1, MF2, MF3,
AND DIR.

If the user catalogs the bank with control cards, he must not use any passwords. This will make it impossible for program INSTAR to change their contents.

A word of caution is needed to inform the user that permanent files are not very permanent. To provide a little extra security, the bank should also be copied to magnetic tape periodically.

THE FOLLOWING CONTROL CARDS WILL COPY THE SAMPLE
"TESTBANK" ONTO THE MAGNETIC TAPE #F162:

ATTACH(MF1,TESTBANK,ID=ROBINSON,CY=1)
ATTACH(MF2,TESTBANK,ID=ROBINSON,CY=2)
ATTACH(MF3,TESTBANK,ID=ROBINSON,CY=3)
ATTACH(DIR,TESTBANK,ID=ROBINSON,CY=4)
REQUEST,TAPE1,HY,ID-F162,WRITE.SWIFT.
REWIND(TAPE1,MF1,MF2,MF3,DIR)
COPYBF(MF1,TAPE1)
COPYBF(MF2,TAPE1)
COPYBF(MF3,TAPE1)
COPYBF(DIR,TAPE1)
REWIND(TAPE1)

17. SAMPLE INPUT PROBLEMS

The first run of the sample problem initializes the bank by reserving four data sets onto the bank. The first data set is a file of weather data with 20 header records and one trailer record. Fields within each record are defined and an abstract is included. The second data set is a file of daily precipitation records. They are input by using the alternate input file, COMMON. The third file is a list of institutions involved in the Grassland Biome. The file description is omitted for this set. The last file contains a set of hawk growth data. After the data sets are reserved, the display and describe commands are used to insure that the files are reserved properly. The input deck for this run

is:

```
TA000,CH47000,....
FTN(R=0,OPT=2)
LGD.
RFL(47000)
ATTACH(BANK,BANK,ID=SHIFT,MR=1)
REDUCE.
BANK(MF1,MF2,MF3,DIR,DATA,PRECIP)
7-8-9
  (FORTRAN program to create file PRECIP)
7-8-9
  (data for FORTRAN program)
7-8-9
  *CATALOG AS TESTBANK FOR ROBINSON
  *RESERVE AS WEATHER
  *LENGTH IS 80 COLUMNS
  *FIRST 20 RECORDS ARE HEADER RECORDS
  *LAST RECORD IS A TRAILER CARD
  *LABEL 1,2 AS MONTH TYPE IS (12)
  *LABEL 3,4 AS DAY TYPE IS (12)
  *LABEL 5 TO 6 AS YEAR TYPE IS (12)
  *LABEL 8 TO 11 AS TIME TYPE IS (12)
  *LABEL 13 , 15 AS MAXAIRTEMP TYPE IS (F3.0)
  *LABEL 16 , 18 AS MINAIRTEMP TYPE IS (F3.0)
  *LABEL 20,22 OBSAIRTEMP (F3.0)
  *LABEL 24,26 AS MAXPANTEMP TYPE IS (F3.0)
  *LABEL 27,29 AS MINPANTEMP TYPE IS (F3.0)
  *LABEL 30,34 AS EVAP TYPE IS (F5.2)
  *LABEL 35,80 AS COMMENTS
  *NOTE THIS IS THE STANDARD WEATHER OBSERVATION DATA COLLECTED ON THE
  *PANNEE SITE BEGINNING JUNE 24, 1970 AND CONTINUING DAILY. EACH RECORD CONTAINS
  *THE DATE AND TIME THE OBSERVATIONS WERE MADE, THE MINIMUM, MAXIMUM AND
  *OBSERVED AIR TEMPERATURES, THE MINIMUM AND MAXIMUM PAN TEMPERATURES, THE AMOUNT
  *OF EVAPORATION FROM THE PAN, AND A SERIES OF COMMENTS PERTAINING TO THE SKY,
  *TEMPERATURE, WIND, AND PRECIPITATION. AT THE END OF EACH MONTH THE DATA SHEETS
  *ARE SENT TO GERM TO BE STORED IN THE DATA BANK. SEE FREEMAN SMITH FOR DETAILS
  *DATA FOLLOWS
  (data to be reserved)
  *RESERVE AS PRECIP
  *NOTE PRECIP CONTAINS THE PRECIPITATION DATA AT THE CENTRAL PLAINS EXPERIMENTAL
  *RANGE, NEFFI, COLORADO. THE PRECIPITATION IS RECORDED DAILY IN INCHES.
  *LABEL COLUMNS 1 TO 2 AS YEAR TYPE IS (12)
  *LABEL 5,6 AS DAY TYPE IS (12)
  *LABEL 11 TO 15 AS RAIN TYPE IS (12)
  *DATA IS ON COMM2
  *RESERVE AS BUDGET01
  (data to be reserved)
  *RESERVE AS HAWKDATA
  *LABEL 1,2 AS PARAMETER TYPE (A2)
  *LABEL 4,5 AS SPECIES TYPE (A2)
  *LABEL 7,8 AS DAY TYPE IS (12)
  *LABEL 9,16 AS BIRD1 TYPE IS (F8.1)
  *LABEL 17,24 AS BIRD2 TYPE IS (F8.1)
  *LABEL 25,32 AS BIRD3 TYPE IS (F8.1)
  *LABEL 33,40 AS BIRD4 TYPE IS (F8.1)
  *LABEL 41,68 AS BIRDS TYPE IS (F8.1)
  *LABEL 49,56 AS BIRD6 TYPE IS (F8.1)
  *LABEL 57,64 AS BIRD7 TYPE IS (F8.1)
  *LABEL 1,5 AS ID TYPE IS (A5)
  *LABEL 9,64 AS BIRDS TYPE IS (F8.1)
  (data to be reserved)
  *DISPLAY FILE NAMES ON DIRECTORY
  *DESCRIBE WEATHER
  *DESCRIBE PRECIP
  *DESCRIBE BUDGET01
  *DESCRIBE HAWKDATA
6-7-8-9

3.1 No file description was used for this reservation. Note that without a file descriptor the actual data begins with record number 00. This means it is possible to select records at the front of the area yet with the command: SELECT IN BUDGET01 AFTER BUDGET01
The file record always contains the file name and the number of corrections made to the data set.

9.) At this point the rest of the old bank is transferred to the new bank and the master files are rotated. This message is printed each time the master files are rotated.

10.) This is a copy of the directory generated by the MFISSPLAY command.

*DE/ 'RE WEATHER
(MER

THIS IS THE STANDARD WEATHER OBSERVATION DATA COLLECTED ON THE
PAWNEE SITE BEGINNING JUNE 24, 1970 AND CONTINUING DAILY. EACH RECORD CONTAINS
THE DATE AND TIME THE OBSERVATIONS WERE MADE, THE MINIMUM, MAXIMUM AND
OBSERVED AIR TEMPERATURES, THE MINIMUM AND MAXIMUM PAN TEMPERATURES, THE AMOUNT
OF EVAPORATION FROM THE PAN, AND A SERIES OF COMMENTS PERTAINING TO THE SKY,
TEMPERATURE, WIND, AND PRECIPITATION. AT THE END OF EACH MONTH THE DATA SHEETS
ARE SENT TO GERL TO BE STORED IN THE DATA BANK. SEE FREEMAN SMITH FOR DETAILS

WEATHER IS FILE NUMBER 1 CONSISTING OF 90 RECORDS WITH 80 CHARACTERS EACH
0 CORRECTIONS. 20 HEADER RECORDS. 1 TRAILER RECORDS.

DEFINED FIELDS	LOCATION	TYPE
MONTH	1- 2	(I2)
DAY	3- 4	(I2)
YEAR	5- 6	(I2)

MINPANTEMP	27- 29	(F3.0)
EVAP	30- 34	(F5.2)
COMMENTS	35- 80	

(1.) This is a file description generated by the DESCRIBE command.

*DESCRIBE PRECIP
PRECIP CONTAINS THE PRECIPITATION DATA AT THE CENTRAL PLAINS EXPERIMENTAL
RANGE, NUNN, COLORADO. THE PRECIPITATION IS RECORDED DAILY IN INCHES.
PRECIP IS FILE NUMBER 2 CONSISTING OF 373 RECORDS WITH 80 CHARACTERS EACH
0 CORRECTIONS. 0 HEADER RECORDS. 0 TRAILER RECORDS.

DEFINED FIELDS	LOCATION	TYPE
YEAR	1- 2	(I2)
MONTH	3- 4	(I2)
DAY	5- 6	(I2)
RAIN	11- 15	(F5.2)

*DESCRIBE BUDGET01
BUDGET01 IS FILE NUMBER 3 CONSISTING OF 40 RECORDS WITH 80 CHARACTERS EACH
0 CORRECTIONS. 0 HEADER RECORDS. 0 TRAILER RECORDS.

(2.) This is the file description that is assumed if there is no description defined.

*DESCRIBE HAWKDATA
HAWKDATA
HAWKDATA IS FILE NUMBER 4 CONSISTING OF 39 RECORDS WITH 80 CHARACTERS EACH
0 CORRECTIONS. 0 HEADER RECORDS. 0 TRAILER RECORDS.

DEFINED FIELDS	LOCATION	TYPE
PARAMETER	1- 2	(A2)
SPECIES	4- 5	(A2)
DAY	7- 8	(I2)
BIRD1	9- 16	(F8.1)
BIRD2	17- 24	(F8.1)
BIRD3	25- 32	(F8.1)
BIRD4	33- 40	(F8.1)
BIRD5	41- 48	(F8.1)
BIRD6	49- 56	(F8.1)
BIRD7	57- 64	(F8.1)
ID	1- 5	(A5)
BIRD5	9- 64	(7F8.1)

The second run of the sample problem modifies the bank by inserting descriptor records into the description for WEATHER, reserving a new data set after WEATHER, inserting descriptor records and data records into BUDGET01, deleting records from BUDGET01, and inserting more data onto the end of HAWKDATA. The files are then displayed and described and a data file is generated with the copy commands. The first copy command is to fetch only the activated records from the WEATHER data set. The second command retrieves the entire file of BUDGET01 including descriptor records, deactivated records and the record id's for each. The input deck is:

WEATHER

THIS IS THE STANDARD WEATHER OBSERVATION DATA COLLECTED ON THE
PANNEE SITE BEGINNING JUNE 24, 1970 AND CONTINUING DAILY. EACH RECORD CONTAINS
THE DATE AND TIME THE OBSERVATIONS WERE MADE, THE MINIMUM, MAXIMUM AND
OBSERVED AIR TEMPERATURES, THE MINIMUM AND MAXIMUM PAN TEMPERATURES, THE AMOUNT
OF EVAPORATION FROM THE PAN, AND A SERIES OF COMMENTS PERTAINING TO THE SKY,
TEMPERATURE, WIND, AND PRECIPITATION. AT THE END OF EACH MONTH THE DATA SHEETS
ARE SENT TO GERL TO BE STORED IN THE DATA BANK. SEE FREEMAN SMITH FOR DETAILS

The third sample run destroys the file BUDGET01 and reserves a new file BUDGET02, which is an output file from a FORTRAN program. Since the length of records in BUDGET02 is variable, the length is set to the maximum of 133 characters. An abstract is also inserted into the file description for HAWKDATA. The copy command is used to reproduce the FORTRAN output file from BUDGET02. The files on the bank are also displayed and described. The input deck is:

```
TAD03,CH47000,...
ATTACH(BANK,BANK,ID=SHIFT,HR=1)
FIN(R=0,DPT=2)
LOG.
RFL(47000)

*DESCRIBE ALL WEATHER

THIS IS THE STANDARD WEATHER OBSERVATION DATA COLLECTED ON THE PAWNEE SITE BEGINNING JUNE 24, 1970 AND CONTINUING DAILY. EACH RECORD CONTAINS THE DATE AND TIME THE OBSERVATIONS WERE MADE, THE MINIMUM, MAXIMUM AND OBSERVED AIR TEMPERATURES, THE MINIMUM AND MAXIMUM PAN TEMPERATURES, THE AMOUNT OF EVAPORATION FROM THE PAN, AND A SERIES OF COMMENTS PERTAINING TO THE SKY, TEMPERATURE, WIND, AND PRECIPITATION. AT THE END OF EACH MONTH THE DATA SHEETS ARE SENT TO GERL TO BE PUNCHED AND STORED IN THE DATA BANK, THE SHEETS ARE THEN RETURNED TO THE PAWNEE SITE. SEE FREEMAN SMITH FOR DETAILS.

WEATHER IS FILE NUMBER 1 CONSISTING OF 93 RECORDS WITH 80 CHARACTERS EACH
2 CORRECTIONS. 20 HEADER RECORDS. 1 TRAILER RECORDS.

DEFINED FIELDS	LOCATION	TYPE
DATE	1- 6	(I6)
MONTH	1- 2	(I2)
DAY	3- 4	(I2)
YEAR	5- 6	(I2)
TIME	8- 11	(I4)
MAXAIRTEMP	13- 15	(F3.0)
MINAIRTEMP	16- 18	(F3.0)
ORSAIRTEMP	20- 22	(F3.0)
MAXPANTEMP	24- 26	(F3.0)
MINPANTEMP	27- 29	(F3.0)
EVAP	30- 34	(F5.2)
COMMENTS	35- 80	

PRECIP RANGE, NUNN, COLORADO. THE PRECIPITATION IS RECORDED DAILY IN INCHES.

PRECIP IS FILE NUMBER 2 CONSISTING OF 373 RECORDS WITH 80 CHARACTERS EACH
0 CORRECTIONS. 0 HEADER RECORDS. 0 TRAILER RECORDS.

DEFINED FIELDS	LOCATION	TYPE
YEAR	1- 2	(I2)
MONTH	3- 4	(I2)
DAY	5- 6	(I2)
RAIN	11- 15	(F5.2)

NEWFILE

NEWFILE IS FILE NUMBER 3 CONSISTING OF 55 RECORDS WITH 80 CHARACTERS EACH
0 CORRECTIONS. 0 HEADER RECORDS. 0 TRAILER RECORDS.

HAWKDATA

THIS IS THE CUMULATIVE HAWK GROWTH DATA FROM BUTCH OLENDORFFS RESEARCH THE DATA WAS COLLECTED FROM 3 DIFFERENT SPECIES OF HAWKS AND 7 BIRDS PER SPECIES THE MEASUREMENTS WERE TAKEN DURING THE FIRST 50 DAYS OF GROWTH FOR EACH BIRD. EACH DATA CARD INCLUDES THE SPECIES THE MEASUREMENTS WERE RECORDED FROM, THE TYPE OF MEASUREMENT, THE AGE IN DAYS OF THE BIRDS AND THE RECORDINGS FOR EACH OF THE 7 BIRDS OF THE SPECIES. IF THE MEASUREMENT WAS NOT TAKEN FOR ONE OF THE BIRDS OF THAT SPECIES FOR THAT DAY, THE CORRESPONDING FIELD WILL BE BLANK. BELOW IS A LIST OF THE CODES USED FOR EACH OF THE MEASUREMENTS AND EACH OF THE SPECIES.

SPECIES CODES

RT RED-TAILED HAWKS
 FH FERRUGINOUS HAWKS
 SH SWAINSONS HAWKS

PARAMETER CODES

6F 6TH PRIMARY FEATHER LENGTH
 BW BODY WEIGHT
 FL FEMUR LENGTH
 CL CRUS LENGTH
 LT LENGTH OF TARSUS AND TOE
 LL LENGTH OF LEG
 TL TARSAL LENGTH
 L3 LENGTH OF 3RD TOE
 HL HUMERUS LENGTH
 AL ANTEBROCHIUM LENGTH
 ML MANUS LENGTH
 WL LENGTH OF WING
 PD BILL DEPTH
 1C LENGTH OF 1ST CLAW
 2C LENGTH OF 2ND CLAW
 RL BILL LENGTH
 WH WIDTH OF THE HEAD

HAWKDATA IS FILE NUMBER 4 CONSISTING OF 92 RECORDS WITH 80 CHARACTERS EACH
 2 CORRECTIONS. 0 HEADER RECORDS. 0 TRAILER RECORDS.

DEFINED FIELDS LOCATION TYPE

PARAMETER	1-	2	(A2)
SPECIES	4-	5	(A2)
DAY	7-	8	(I2)
BIRD1	9-	16	(F8.1)
BIRD2	17-	24	(F8.1)
BIRD3	25-	32	(F8.1)
BIRD4	33-	40	(F8.1)
BIRD5	41-	48	(F8.1)
BIRD6	49-	56	(F8.1)
BIRD7	57-	64	(F8.1)
ID	1-	5	(A5)
BIRDS	9-	64	(7F8.1)

BUDGET02

BUDGET02 INCLUDES A LIST OF ALL INSTITUTIONS INVOLVED IN THE GRASSLANDS BIOME OF THE INTERNATIONAL BIOLOGICAL PROGRAM. WITH EACH INSTITUTION IS THE CODE NUMBER. THE BENEFIT AND OVERHEAD RATE, AND THE BASIS FOR CALCULATING THE OVERHEAD. THESE VALUES ARE USED BY THE BUDGET PROGRAM IN PREPARING THE BUDGET FOR EACH FISCAL YEAR. BUDGET02 IS PRODUCED BY A FORTRAN PROGRAM CALLED LISTER INSTITUTIONS AND RATES ARE CORRECT AS OF FFBR. 14, 1971. SEE BOB ROBINSON AT GERL FOR FURTHER INFORMATION.

BUDGET02 IS FILE NUMBER 5 CONSISTING OF 66 RECORDS WITH 133 CHARACTERS EACH
0 CORRECTIONS. 10 HEADER RECORDS. 0 TRAILER RECORDS.

DEFINED FIELDS	LOCATION	TYPE
NUMBER	2- 3	(I2)
INST	5- 34	(3A10)
CODE	35- 37	(I3)
BENEFITS	38- 49	(F12.4)
OVERHEAD	50- 63	(F14.4)
BASIS	72- 74	(A3)

*COPY BUDGET02

The fourth run for the sample problem displays six different examples for the use of the select commands. The *COPY INPUT commands are used to prepare header records onto the DATA file for each of the six examples, and the *COPY SCRATCH commands are used to store the selected information onto the DATA file. The input deck is:

```
TA001,CM47000,...
ATTACH(BANK,BANK,ID=SWIFT,MR=1)
REDUCE.
BANK(,,,MYFILE)
REWIND(MYFILE)
COPYCF(MYFILE,OUTPUT)
7-8-9
*BANK IS ON TESTBANK FOR ROBINSON
*COPY INPUT
1 THE FIRST SELECTION WILL BE FOR 10 RECORDS FROM THE WEATHER FILE

*SELECT FROM WEATHER 10 RECORDS
*COPY SCRATCH
*COPY INPUT
1 THE SECOND SELECTION IS FOR ALL WEATHER RECORDS FOR THE MONTH OF JULY

*SELECT FROM WEATHER ALL RECORDS FOR WHICH MONTH IS EQUAL TO 7
*COPY SCRATCH
*COPY INPUT
1 THE THIRD SELECTION IS FOR ALL DATES THAT THE TEMPERATURE EXCEEDED 90 DEGREES

*SELECT FROM WEATHER ALL VALUES OF DATE FOR WHICH MAXAIRTEMP IS GREATER THAN 90
FOR COLUMNS 2 TO 9
*COPY SCRATCH
*COPY INPUT
1 THE FOURTH SELECTION IS FOR THE DATES DURING NOVEMBER AND DECEMBER THAT
THERE WAS A RAIN

*SELECT FROM PRECIP ALL RECORDS FOR WHICH MONTH IS BETWEEN 11 AND 12
*SELECT FROM SCRATCH ALL OF COLUMNS 1 TO 6 FOR WHICH RAIN IS GREATER THAN 0.0
FOR COLUMNS 10,20
*COPY SCRATCH
*COPY INPUT
1 THE FIFTH SELECTION WILL BE FOR ALL NON-CSU INSTITUTIONS WHICH CALCULATE
OVERHEAD ON THE BASIS OF SALARIES WAGES AND BENEFITS.

*SELECT FROM BUDGET02 ALL RECORDS FOR WHICH CODE IS BETWEEN 13 AND 98
*SELECT FROM SCRATCH ALL INST FOR WHICH BASIS IS EQUAL TO /SWB/ FOR COLUMNS 2 TO
31
*COPY SCRATCH
*COPY INPUT
1 THE SIXTH SELECTION WILL COMBINE THE TEMPERATURE RECORDS FROM WEATHER WITH
THE RAINFALL RECORDS FROM PRECIP FOR THE MONTH OF JULY

*SELECT FROM WEATHER ALL VALUES OF COLUMNS 1 TO 22 FOR WHICH MONTH IS EQUAL
TO 7 FOR COLUMNS 2 TO 23
*SELECT FROM PRECIP ALL VALUES OF RAIN FOR WHICH MONTH IS EQUAL TO 7
FOR COLUMNS 30 TO 40
*COPY SCRATCH
6-7-8-9
```

List of Example Commands Accepted by INSTAR.

Maintenance commands.

- *RESERVE AS FILEA
- *RESERVE AS FILEB AFTER FILEA
- *INSERT IN FILEA
- *INSERT IN FILEA AFTER FILEA.123
- *DELETE IN FILEA FILEA.12
- *DELETE IN FILEA FROM FILEA.33 TO FILEA.162
- *RESTORE IN FILEA FILEA.63
- *RESTORE IN FILEA FROM FILEA.78 TO FILEA.172
- *DESTROY FILEA

Descriptor commands

- *LABEL COLUMN 4 AS FIELD1
- *LABEL COLUMN 5 AS FIELD2 TYPE IS (11)
- *LABEL COLUMNS 6 TO 10 AS FIELD3
- *LABEL COLUMNS 11 TO 30 AS FIELD4 TYPE IS (2A10)
- *FIRST RECORD IS A HEADER RECORD
- *FIRST 10 RECORDS ARE HEADER RECORDS
- *LAST RECORD IS A TRAILER RECORD
- *LAST 35 RECORDS ARE TRAILER RECORDS
- *NOTE
- *DATA FOLLOWS
- *DATA IS ON COMMON

Retrieval commands

- *DISPLAY
- *DESCRIBE FILEA
- *DESCRIBE ALL FILES
- *COPY INPUT
- *COPY COMMON
- *COPY SCRATCH
- *COPY FILEA
- *COPY FILEA FROM FILEA.1 TO FILEA.67
- *SELECT FROM FILEA ALL RECORDS
- *SELECT FROM FILEA 17 RECORDS
- *SELECT FROM FILEA ALL RECORDS FOR WHICH FIELD1 IS EQUAL TO 123.67
- *SELECT FROM FILEA 10 RECORDS FOR WHICH FIELD2 IS NOT EQUAL TO /BISON/
- *SELECT FROM FILEA ALL VALUES OF FIELD1 FOR COLUMNS 1 TO 10
- *SELECT FROM FILEA 10 VALUES OF FIELD1 WHICH ARE GREATER THAN 0.0 FOR COLUMNS 11 TO 20
- *SELECT FROM FILEA ALL VALUES OF FIELD1 FOR WHICH FIELD2 IS GREATER THAN OR EQUAL TO /MONTANA / FOR COLUMNS 21 TO 30
