RE: Preparation of patient education bibliographies by the MCRMLP

The MCRMLP Regional Development Coordinator, Karen Hackleman, has been charged by the MCRMLP Advisory Council to form a group and devise a protocol in order to publish patient education bibliographies. The protocol they have established is to survey a few hospitals in each state and find out what the 10 to 15 most common admitting diagnoses are in medicine and in surgery. After determining the most common, the committee will prepare bibliographies on patient education for those problems.

Karen has asked me to gather this information from Colorado. Those of you who can, please find out this information from your medical records department. It may or may not be available. Please send me the lists, including your bed size by April 10th. You need not put the name of your hospital on the lists. (Also if you have any statistical sources that may be helpful in determining these diseases, please send them, too) This will be a rough sample to be used as a guideline.

The bibliographies that will be the end product of this effort will be available from the region when finished.
