Fort Collins, Colorado

GRASSLAND BIOME

U.S. International Biological Program

March 1974

## PREFACE

The following pages contain tables of *theoretical* solar data for IBP Grassland Sites in North America. The data is *theoretical* because it is based on spherical geometry relating the earth's motions with respect to the sun. The data values do not account for local slope orientation and shadows. Solar energy values are for a horizontal surface at the top of the atmosphere. *Actual* solar energy received at the ground surface is determined by the transmissivity of the atmosphere, which is a function of clouds, water vapor, and atmospheric particles. *For a very general rule-of-thumb, actual solar energy (on an annual basis) is about 50% of the theoretical.*

For each month, the tables contain:

1. Hourly theoretical solar energy (langleys) with daily totals  
non-leap years ... p. 2-13  
leap years ... p. 19-30
2. Day length (hours) non-leap years ... p. 14  
leap years ... p. 31
3. Time of sunrise (local standard time) non-leap years ... p. 15  
leap years ... p. 32
4. Time of sunset (local standard time) non-leap years ... p. 16  
leap years ... p. 33
5. Time of solar noon (local standard time)  
non-leap years ... p. 17  
leap years ... p. 34
6. Graph of theoretical solar energy (langleys)  
non-leap years ... p. 18  
leap years ... p. 35

These tables were generated by a program (revised February 1973) written by G. M. Furnival, W. E. Reifsnyder, E. Wyler, and T. G. Siccama of the Yale School of Forestry, New Haven, Connecticut. We express our appreciation to Dr. George M. Furnival for providing us with the program.
