Bird List	Ronald R. Ryder	CSU-Fishery & Wildlife Biology
Mammal List	Richard Hansen	CSU-Range Science
Climatological Data	Gary Bertolin	CSU-Atmospheric Science
	Robert Engel	USDA-ARS

ABSTRACT

The Pawnee Site, the Intensive Site location of the Grassland Biome, lies within the western division of the Pawnee National Grasslands which is administered by the U.S. Forest Service. At the western edge of the Pawnee National Grasslands lies the Central Plains Experimental Range operated by the Agricultural Research Service. Intensive studies requiring careful experimental control are conducted on the Central Plains Experimental Range; more extensive studies requiring a great deal of space but less control are conducted on the Pawnee National Grasslands.

HISTORY

First agricultural use of the Central Great Plains was livestock grazing on the open range. Later homesteading under quarter-section and half-section limitations brought most of the land under private ownership. Purchase and lease of land grant railroad sections and state school lands also aided in placing more than 90% of the total area under farm and ranch management. Most of the homesteaders attempted to grow cultivated crops by eastern farming methods. The native sod on millions of acres was plowed to the detriment of both soil and man. These farming methods opened the way for wind erosion during the agricultural depression from 1921-1939 (Klipple and Costello, 1960). The abandonment of cultivation beginning soon after settlement resulted in all stages of secondary succession from nearly bare fields to areas which have almost, if not entirely, returned to the original condition (Costello, 1944). Because a large proportion of the land was abandoned during the depression and dust bowl years, land utilization projects were established as management units of this abandoned land. These land utilization projects were first administered by the Soil Conservation Service until the Agriculture Reorganization Act in 1953; since that time the lands have been administered by the U.S. Forest Service. The Pawnee National Grassland is therefore made up of the abandoned portions of these lands which are interspersed with lands remaining in private ownership. Private and public lands are frequently operated together. In the western division of the Pawnee National Grasslands the livestock operation is largely through the Crow Valley Livestock Association, an association of many small ranchers in the area. The federal lands are usually used for summer grazing at a moderate rate, while private lands are used for winter grazing.

LOCATION AND LAND MANAGEMENT

The Pawnee Site is made up of two administrative units, the Central Plains Experimental Range and the Pawnee National Grassland (Fig. 1). The western division of the Pawnee National Grasslands is about 105,000 acres and the Central Plains Experimental Range about 15,000 acres.

The Central Plains Experimental Range portion of the Pawnee Site is about 12 miles northeast of Nunn, Colorado, and 25 miles south of Cheyenne, Wyoming. The Range was established in 1939 to answer many questions which were obviously important as a result of the land use of the 1930's. A number of pastures were set aside for long-term experiments. A number of scientific publications have resulted (Appendix A). Twelve half-section (320 acres) pastures were assigned four each to heavy, moderate, and light summer grazing. In 1958 two of the replicates were changed to winter grazing.

Each of these and several other pastures also have at least one exclosure of one or two acres excluding grazing since 1939. Permanent quadrats have been established in these pastures, and in most years composition of vegetation has been measured.

All of the Central Plains Experimental Range is available for IBP use, but some is primarily dedicated to other studies conducted by the Agricultural Research Service and IBP studies on these pastures are of an incidental nature. Other pastures, however, have been designated for more intensive use of the IBP. The Pawnee National Grasslands, as mentioned above, is available for extensive studies which require a great deal of land area but do not require rigid control for experimental purposes. For example, such studies are jackrabbit population dynamic studies, bird population studies, etc. The Central Plains

Experimental Range portion, on the other hand, is utilized for intensive studies which require greater control.

TYPE OF GRASSLAND

The native shortgrass range vegetation described by Klipple and Costello (1960) is a basically blue grama and buffalo grass, supplemented in many areas by thread leaf and needle leaf sedges. Several midgrasses, such as western wheatgrass, needle-and-thread, green needle grass, little bluestem and side oats grama grow in association with the shortgrasses. These associated species seldom attain sufficient densities to dominate the vegetation type, although they may at times provide an inconspicuous part of the aspect.

Perennial forbs which are commonly found include scarlet globemallow (*Sphaeralcea coccinea*), slim flower scurfpea (*Psoralea tenuiflora*), slenderbush eriogonum (*Eriogonum microthecium*), and scarlet gaura (*Gaura coccinea*). Various other forms may become conspicuous in wet years. Annual forbs include Russian thistle, (*Salsola kali tenuifolia*), cryptantha (*Cryptantha spp.*), stickseed (*Lappula spp.*), pale evening primrose (*Oenothera pallida*), lambs-quarter (*Chenopodium spp.*), and bee flower (*Cleome serrulata*). Fringed sagewort (*Artemisia frigida*), saltbrush (*Atriplex canescens*), and winterfat (*Eurotia lanata*) are leading browse species; other shrubs include rubber rabbitbrush (*Chrysothamnus nauseosus*), broom snakeweed (*Gutierrezia sarothrae*), and big sagebrush (*Artemisia tridentata*). Plains prickly pear (*Opuntia polyacantha*) is widely distributed on the experimental area. A list of plant species collected prior to 1968 is included in Table 1.

Common mammals of the area are antelope, white-tailed jackrabbit (*Lepus townsendii*), black-tailed jackrabbit (*Lepus californicus*), 13-lined ground

squirrel (*Spermophilus tridecemlineatus*), northern grasshopper mouse (*Onychomys leucogaster*), Ord's kangaroo rat (*Dipodomys ordii*), and deer mouse (*Peromyscus maniculatus*). Other mammals which have been found on the area are shown in Table 2.

The most common birds on the area are the very conspicuous lark bunting (*Calamospiza melanocorys*) and the horned lark (*Eremophila alpestris*). Other birds which have been found previously on the area are shown in Table 3.

As for insects, the various species of grasshoppers are certainly the most predominant. From the over 30 orthopteran insects the most common are *Melanoplus gladstoni* and *Xanthippus corallipes*. Scarab beetles (Scarabaeidae) are common insects in the soil.

CLIMATE

The site is in the western part of the Central Great Plains where the average annual precipitation varies from 10 to 15 inches. About 80% of the precipitation falls during the summer months of May through September. Although most of the storms are light summer thundershowers, the greatest fluctuations are caused by storms greater than one inch. Seasonal distribution of precipitation is shown in Fig. 2.

Temperature records have been collected from the experimental range since 1947. Monthly annual temperatures are shown in Fig. 3.

On the intensive portion of the Pawnee Site common soil series are Ascalon, Vona, Renohill, and Shingle. The Renohill and Shingle series are formed on shale and siltstone outcrops of the Pierre sedimentary formation, while the Ascalon series is formed predominantly by fluvial outwash materials. The Vona generally is formed by somewhat courser outwash materials. Interspersed among these upland soils are alluvial plains of more recent origin.

These alluvial plains are high in clay content. The name Nunn is frequently given to these alluvial soils, although this nomenclature will not be adequate in all cases. Topography is gently rolling with few predominant topographic features. Soil texture classes by profile of the common soils are given in Table 4, and soil distributions are shown in Fig. 4.

PHYSICAL FACILITIES

The Pawnee Site includes a dining room, kitchen, laboratory facility, the 12-man dormitory, a garage, storage facility, wells, resident building, corrals, fences, etc. Plans of the various buildings are shown in Appendix B.

Table 3. A checklist of birds of the Pawnee Site in north central Colorado
 (Compiled by Ronald A. Ryder).

AOU Number	Species	AOU Number	Species
004	Eared Grebe	264	Long-billed Curlew
001	Western Grebe	265	Whimbrel (one record only)
006	Pied-billed Grebe	261	Upland Plover
194	Great Blue Heron	263	Spotted Sandpiper
202	Black-crowned Night Heron	256	Solitary Sandpiper
203	Yellow-crowned Night Heron	258	Willet
172	Canada Goose	254	Greater Yellowlegs
132	Mallard	255	Lesser Yellowlegs
135	Gadwall	239	Pectoral Sandpiper
143	Pintail	241	Baird's Sandpiper
139	Green-winged Teal	242	Least Sandpiper
140	Blue-winged Teal	232	Long-billed Dowitcher
141	Cinnamon Teal	249	Marbled Godwit
137	American Widgeon	251	Hudsonian Godwit
142	Shoveler	225	American Avocet
146	Redhead	224	Wilson's Phalarope
147	Canvasback	223	Northern Phalarope
148	Greater Scaup	053	California Gull
149	Lesser Scaup	054	Ring-billed Gull
151	Common Goldeneye	059	Franklin's Gull
167	Ruddy Duck	069	Forster's Tern
129	Common Merganser	077	Black Tern
325	Turkey Vulture	313.1	Rock Dove
333	Cooper's Hawk	316	Mourning Dove
332	Sharp-shinned Hawk	365	Barn Owl
337	Red-tailed Hawk	375	Great Horned Owl
342	Swainson's Hawk	378	Burrowing Owl
347	Rough-legged Hawk	366	Long-eared Owl
348	Ferruginous Hawk	367	Short-eared Owl
349	Golden Eagle	418	Poor-will
352	Bald Eagle	420	Common Nighthawk
331	Marsh Hawk	432	Broad-tailed Hummingbird
354	Gyrfalcon	390	Belted Kingfisher
355	Prairie Falcon	413	Red-shafted Flicker
356	Peregrine Falcon	406	Red-headed Woodpecker
357	Pigeon Hawk	393	Hairy Woodpecker
360	Sparrow Hawk	394	Downy Woodpecker
293	Scaled Quail	444	Eastern Kingbird
309	Ring-necked Pheasant	447	Western Kingbird
206	Sandhill Crane	448	Cassin's Kingbird
214	Sora	457	Say's Phoebe
221	American Coot	464	Western Flycatcher
273	Killdeer	462	Western Wood Pewee
281	Mountain Plover	459	Olive-sided Flycatcher

APPENDIX B

PHYSICAL FACILITIES AT THE PAWNEE SITE

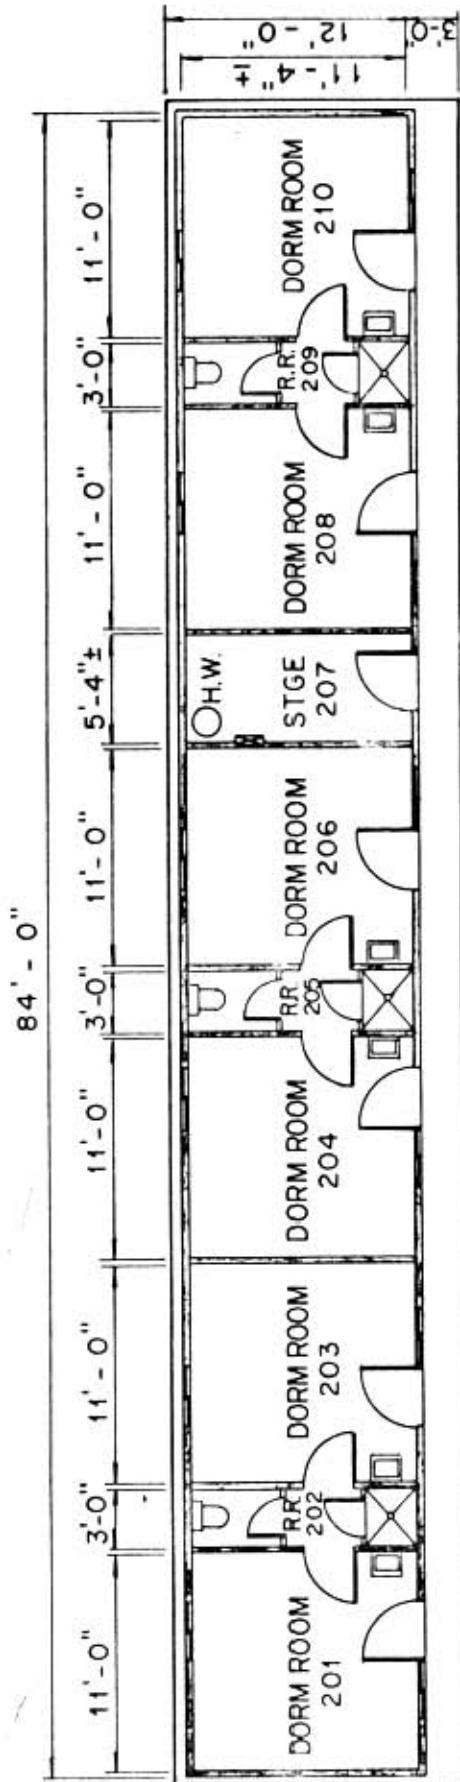

PAWNEE SITE CORRAL DETAIL

SITE PLAN I BP NUNN, COLORADO

DORMITORY BUILDING FLOOR PLAN

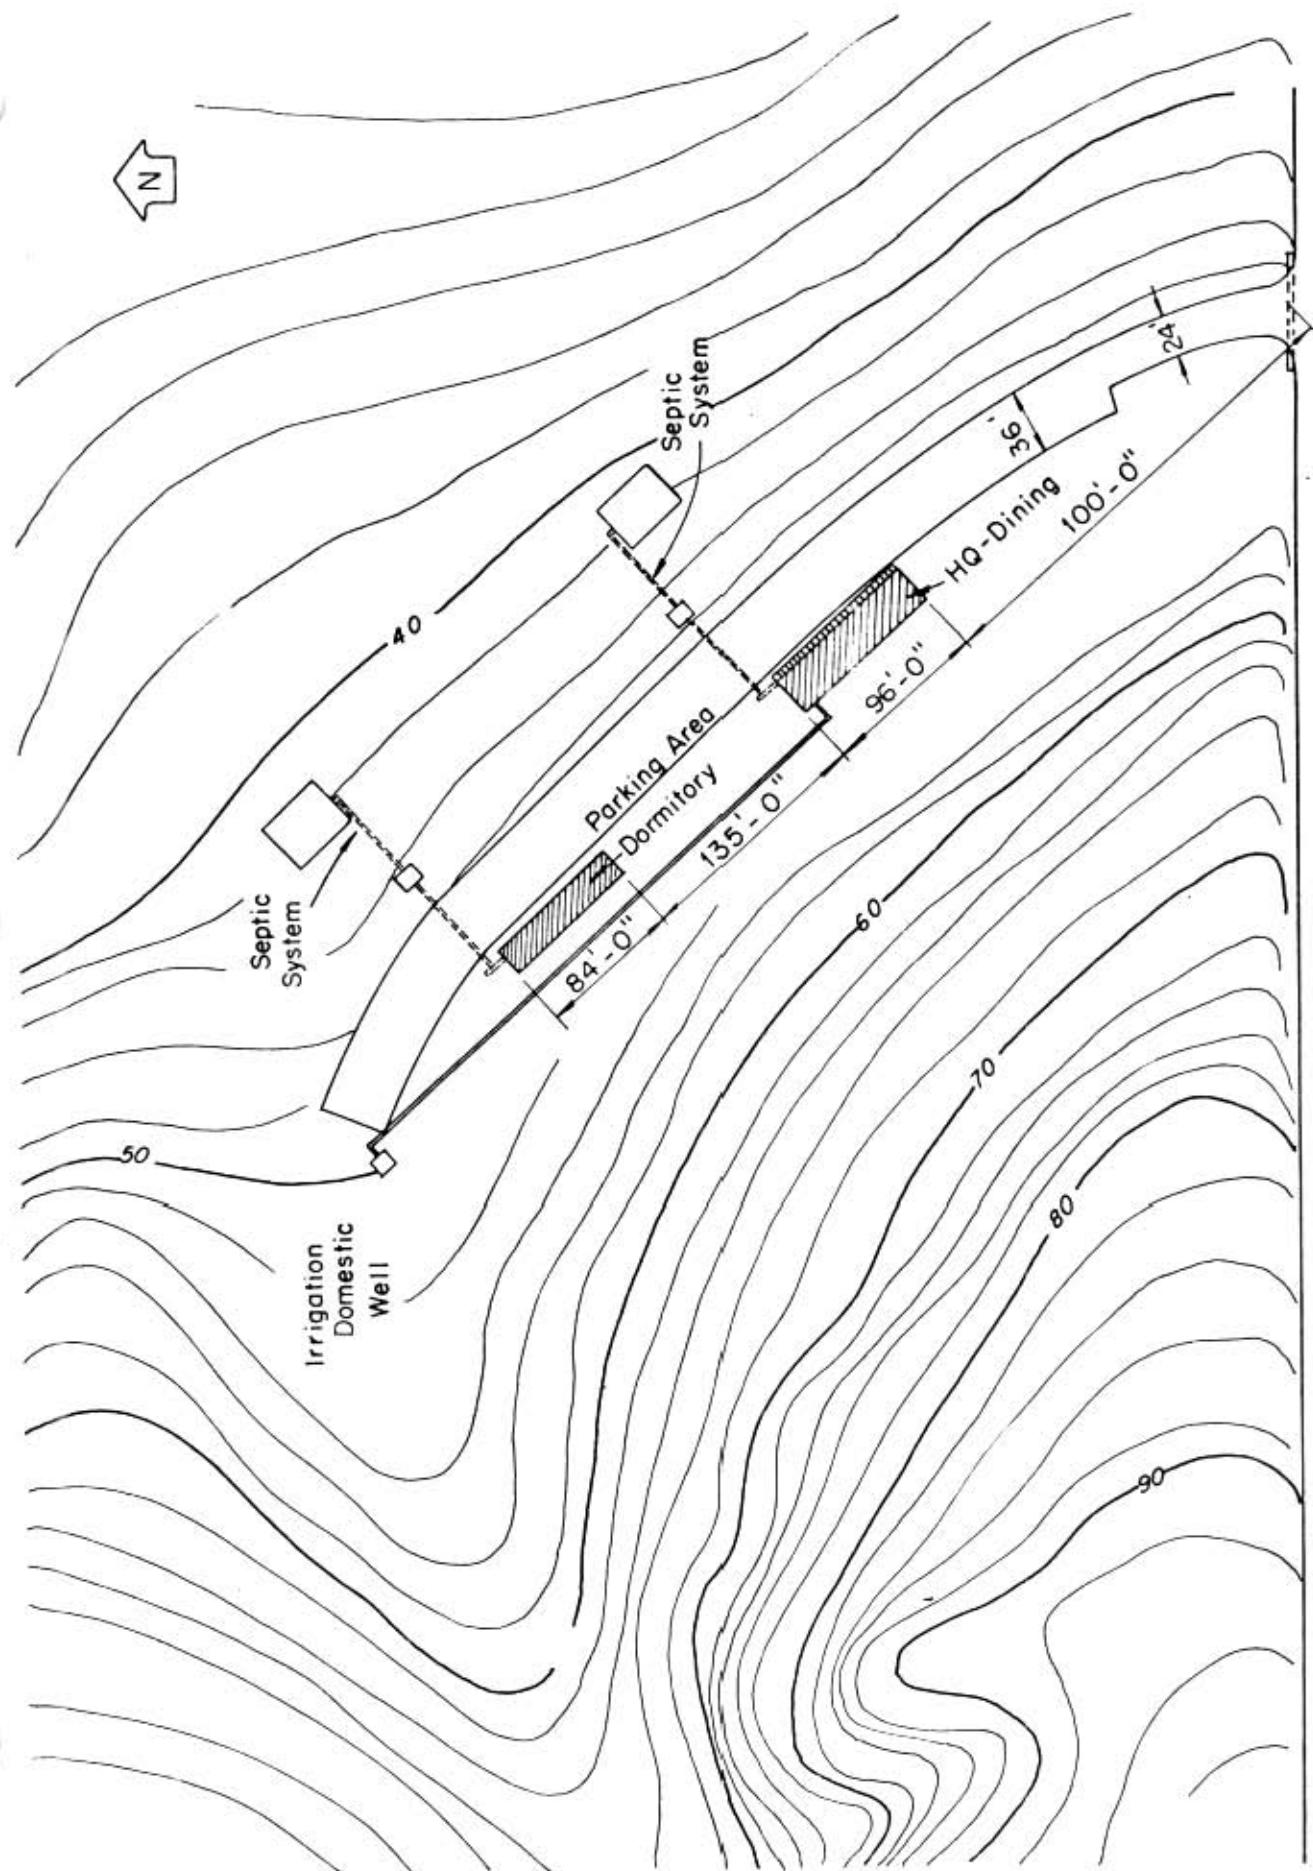

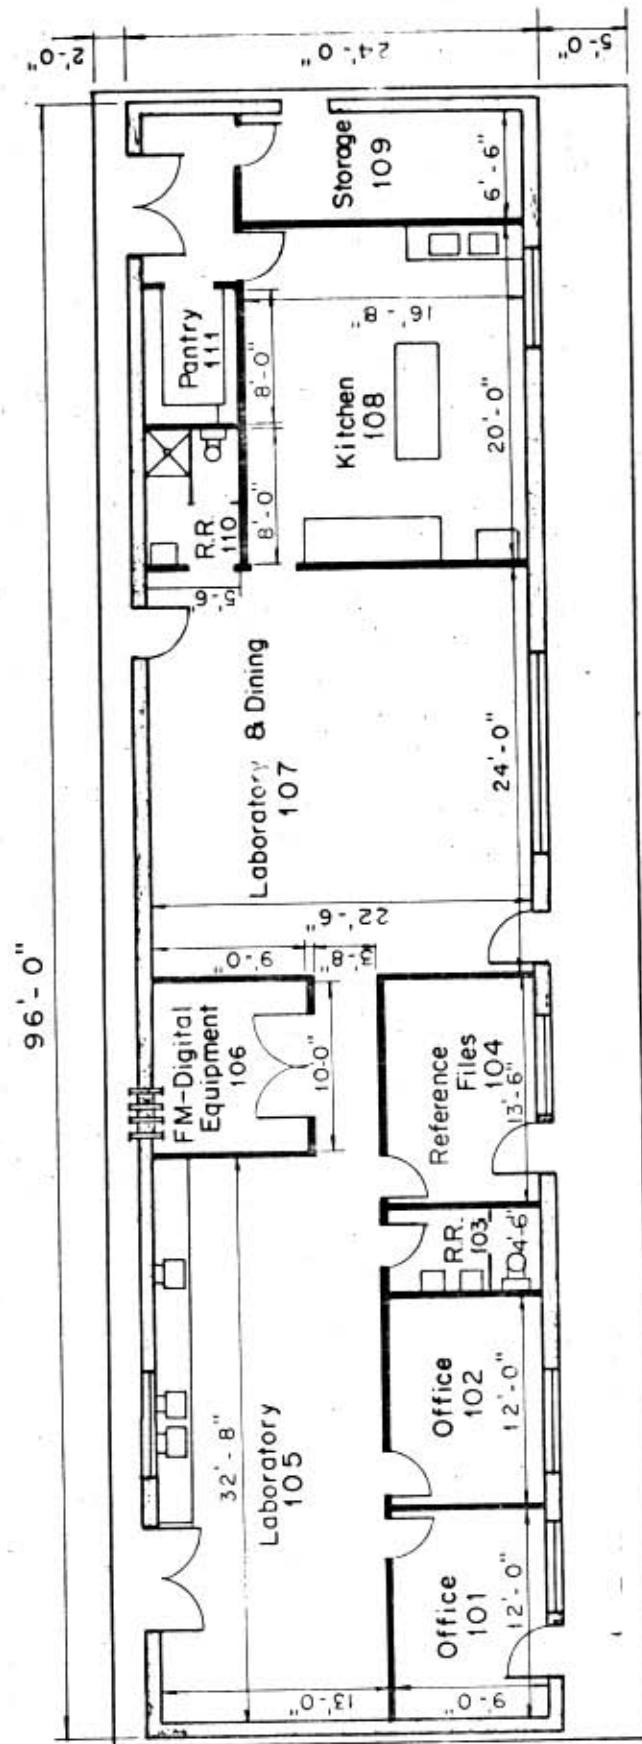

Figure 6.51.4

SITE PLAN - INTERNATIONAL BIOLOGICAL PROGRAM

HEADQUARTERS BUILDING FLOOR PLAN

A field laboratory-office and a minimal dormitory facility will soon have been constructed from the first year's funding. Eight of the microwatersheds have been completed and others soon will be. General plans for necessary additions to facilities and equipment have been developed. In our continued quest for optimality, however, a major portion of the Pawnee Site Director's time during the coming year will be concerned with design modifications of field facilities which will be most useful in promoting the various measurements and experiments.

Other details on progress to date were covered in Section 4 of this proposal; details of equipment to be purchased and cost estimates of facilities are included in the budget portion (Section 9).

Field laboratory. Major laboratory analyses will be conducted in the central laboratory on the CSU campus (see Section 6.2). Field laboratory studies at the Pawnee headquarters will be restricted to those requiring immediate analyses, and as such, will be minimal in nature. Special emphasis will be on sample freezing and drying, field reference collections, etc., (Figure 6.51.3). Although the lab building will be completed from the first year's money, some equipment remains to be added.

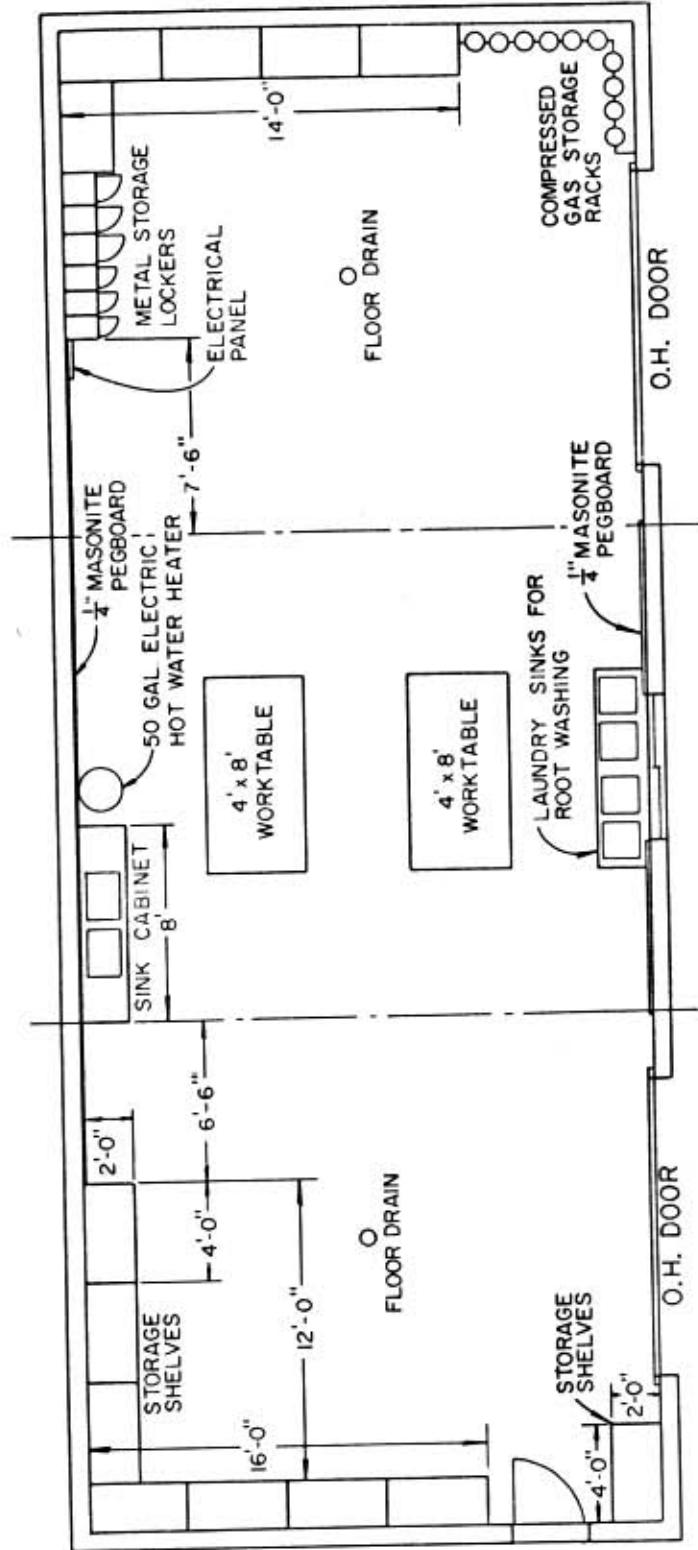

Buildings. Funds are requested for (a) a residence for the site resident, and (b) a storage building-garage. Both of these buildings were foreseen in the original proposal but were deferred for lack of funding. We will probably use a mobile home for the residence, and an unheated, uninsulated slab-on-grade construction for the garage. Space for these buildings has been provided in the general building plan (Figure 6.51.4). At this time we are not requesting funds for additional dormitory space; we will first determine the amount of occupancy of the existing dormitory (Figure 6.51.5).

System stress control. Facilities will be developed to provide adequate control of system stress so that experiments on system stress can proceed on a predetermined schedule. These sites will be fully instrumented with adequate meteorological and hydrological instrumentation. Part of the basic meteorological equipment was procured with the first year's funds.

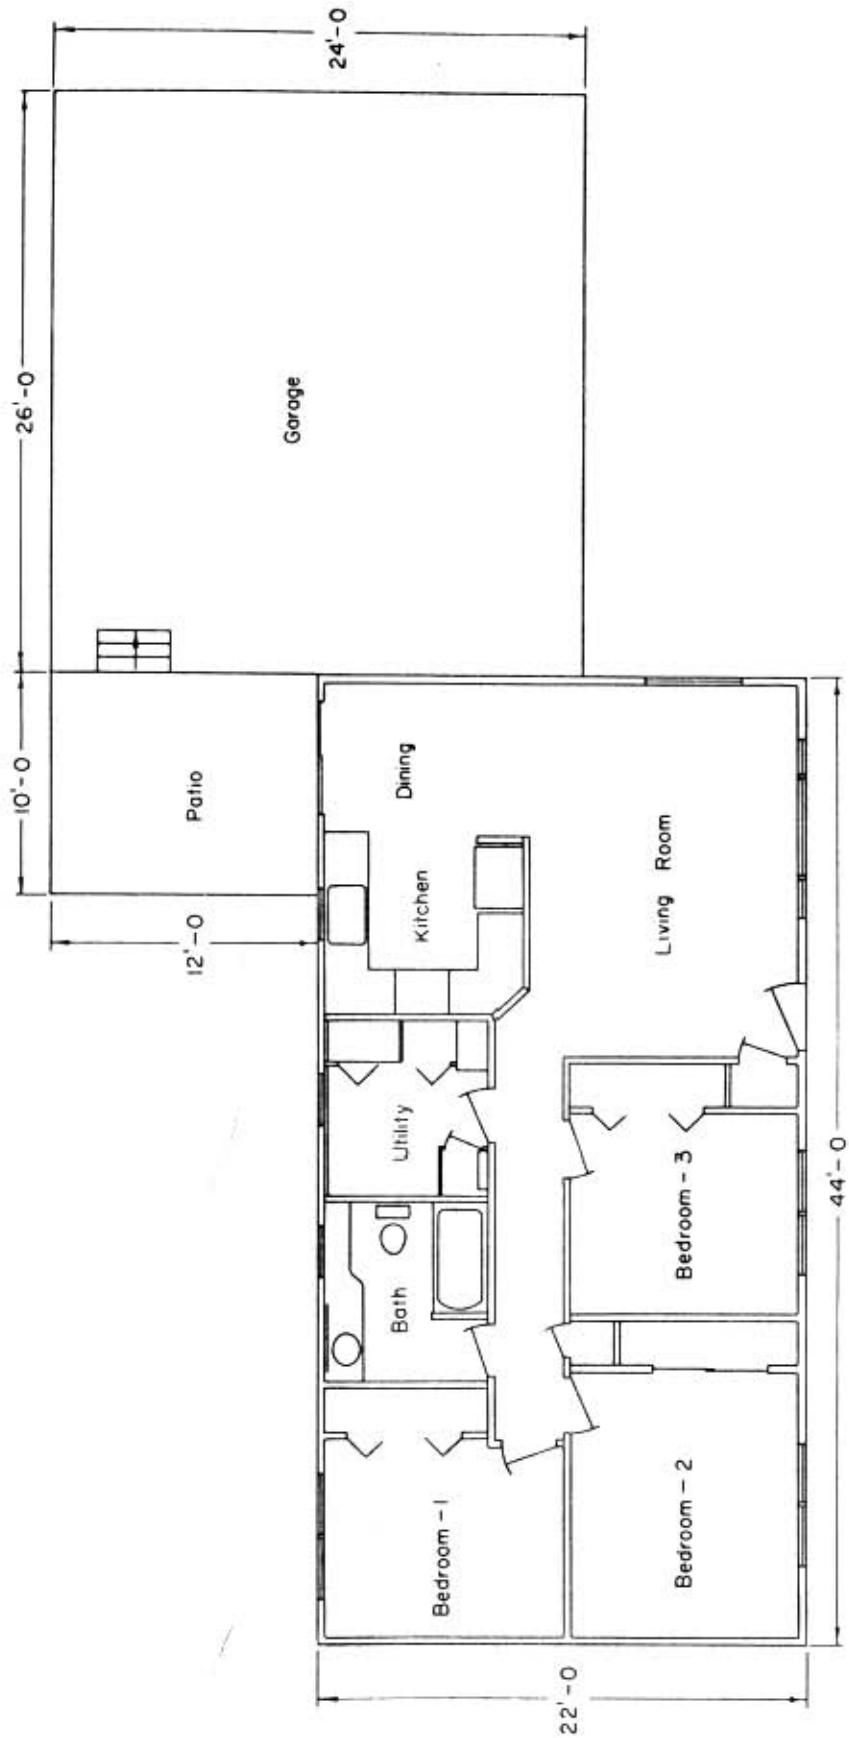

Instrumentation, power and cable, and data acquisition. Because of the great amount of data to be collected, a rapid means of handling data is essential. The necessary instrumentation requires an adequate power source, cables to return data to a data-acquisition system, and the data acquisition system itself.

A special room has been provided in the laboratory building for the data acquisition equipment. For the sake of economy, some cables leading to the microwatersheds were installed at the same time the telephone to the site was installed; other cables and power lines to individual research sites still remain to be completed.

Mobile laboratory. During the first year's effort, we have developed field equipment for a number of measurements. In some cases, strip chart recordings have been made to facilitate debugging the equipment. Our eventual goal in this area is to have an integrated mobile laboratory which can handle meteorology, photosynthesis measurements, and evapotranspiration measurements, and store the data with a single data-acquisition system.
