

1997

LOCATION	BLOCK	TRANSECT	PLANT	CULM LENGTH	# SEED HEADS	CULM WEIGHT	# SEEDS	SEEDS WEIGHT	# CULMS
----------	-------	----------	-------	----------------	-----------------	----------------	---------	-----------------	---------

LABELING

SP = Seed Production

ESA = Location

B1 = Block #

7 = Transect

P2 = Plant #

All Labeling the same for Biomass & Inflorescence
only Biomass will be labeled biomass.

(9) 10 Locations

ULM

3 blocks at each location

3 transects at each block

8 plants along each transect.

should be approx 960 envelopes

For Inflorescence/culm

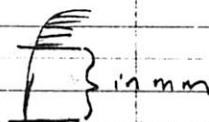

Biomass - 10 Locations

10 plants each location

100 Biomass

Steps for culm Inflorescence:

1. meas. culm length in mm

if 2 inflorescences
meas. to top of base
seed head.

#2. Weigh out sample

- record wt & # of culms

#3. save inflorescence.

#4. Label envelope with (4) & cut inflore off & put back in
envelope & save for seed extraction,
- seed cut. later.

1. Biomass envelopes all labeled as biomass.

Biomass

2. separate between old dead = gray color

- throw out old dead

3. Save the rest & put back in envelope.

- any green (living) mat. } save
- yellow material }

10 Locations

• ESA

• HG (Heavy Grazed)

• 4G & 6G (grazing strip)

• Mat (station) - 4G

• Mat (station) - 6Z

• 2IN - Grazed

• 2IN - ungrazed

• OW/Creek

• 24 Double cantera

• 2INGZ

• 2INUG

• 23 & 3E

• OC

• RDC

• SEC25
